This new species has been imported for L. Gouldiana which it resembles somewhat. It belongs to the group of *Laelias* of which *L. autumnalis*, *L. albida*, *L. Gouldiana* and *L. Crawshawiana* are members. It is distinct from either by its flowers, color and the remarkable free growing qualities. The pseudo-bulbs are 4 to 6 inches long, pyriform and deeply

furrowed. The leaves are in pairs, 5 to 7 inches long, leathery, lanceolate, very thick dark green; scape 1 to 4 feet long bearing 3 to 11 flowers; sepals and petals broad pointed, slightly reflexed at the end; of a rich warm rose color shading off towards the center; lip three-lobed, the lateral lobes straight, white or pale rose, middle lobe reflexed, deep rose purple at the end, pale towards the center, the interior traversed by two yellow ridges spotted purple.

The accompanying photograph will show clearly its distinctive points.

This fine species is dedicated to Hicks Arnold, Esq., of New York city, one of the most ardent lovers of orchids.

W. A. MANDA.

Notes From the Bussey Institute.

BY WM. FALCONER.

The Bussey Institute is the horticultural and agricultural department of Harvard University, and is situated at Jamaica Plain, a few miles from Boston and within four or five minutes walk of Forest Hills railroad station. This horticultural department, although alongside of the Arnold Arboretum, is entirely independent of it, as it also is of the Botanical Garden which is at Cambridge, several miles away. Prof. B. M. Watson is the instructor in horticulture, and his whole time is devoted to this work. He is a son of B. M. Watson, the nurseryman at Plymouth, Mass., and a graduate of Harvard, and has been the instructor in the horticultural department of the great university for the past ten years.

The lecture rooms and laboratories are in a handsome stone building surrounded by spacious grounds, and near by are several roomy greenhouses filled with all manner of plants. Charles Dawson, a son of the eminent Jackson Dawson, superintendent of the Arnold Arboretum, is in charge of the greenhouses, and, like his father, is an enthusiast in his profession.

The students are not only instructed in scientific research in the laboratories, but they also receive a practical outdoor and indoor training in horticulture, more especially in floriculture. But the training received at an institution of this sort is not enough to render a young man a proficient gardener or florist, it is an elementary rather than a finishing school. After studying here for a season he should enter some first class practical establishment like the Ames or Hinnewell gardens, if inclined to ornamental gardening, or the John May or Peter Henderson establishments if commercially disposed.

The greenhouses are the ones that used to be occupied by the Arnold Arboretum, and are roomy span-roofed structures. They contain a large assortment of miscellaneous plants and a good deal of attention is paid to growing plants to furnish quantities of flowers for Prof. Goodale's botanical lectures. The following were among the most noticeable plants in bloom at the time of my visit.

EPIPHYLLUM TRUNCATUM.—A pereskia vine had been planted in the border under the bench of a greenhouse and trained up under a rafter, and into this vine some years ago epiphyllums had been grafted. Three bunches were allowed to remain, and they now are immense hanging masses, say $3\frac{1}{2}$ feet wide by as much long, and covered with blossoms. Until two years ago they used to flower in November, but as they increase in size they bloom later till now it is January before they are in full beauty.

MAYFLOWERS IN POTS.—There was a

lot in one of the greenhouses and they were about breaking into bloom. In pots, pans or flats we can cultivate this precocious little beauty fairly well, but in the open garden it is very refractory.

EXACUM AFFINE in the form of bushy little plants about 9 inches high were thickly dotted all over with bluish-lilac fragrant flowers. It is a little gentian-wort from Socotra, and a few years ago was introduced to our notice as a prominent novelty by our seedsmen. Of no use for cut flowers.

CRASSULA QUADRIFIDA is worth growing as a house or bracket plant. It is easily grown in pots or baskets and thrives running wild along the greenhouse paths where ferns delight to grow, only it wants good light to induce it to bloom. A fleshy leaved plant with a profusion of panicles of small pinkish star shaped flowers. Easily raised from seed, cuttings or leaves.

IRIS JAPONICA was in good bloom. When nicely grown in pots it is a very pretty species; has fimbriated pale blue flowers and evergreen foliage. Although sometimes treated as a hardy plant, I have never found it perfectly satisfactory except when wintered indoors or in frames.

IRIS RETICULATA too was grown in pots. It is a gem, its flowers are dark purple, violet and gold and deliciously fragrant. But it is perfectly hardy and comes up and blooms year after year, and apart from I. Korolkowii the earliest blooming of all irises with me; it comes into bloom at the same time as do the crocuses and Siberian squills.

IRIS SUSIANA was growing finely in pots but not yet in flower. Among irises for pot culture this is one of the best. It is of neat growth and has very large, showy flowers, dotted and streaked brownish-black on a whitish ground-work. Roots first season after importing seldom give as fine flowers as they do after they have been well grown here for a year or more. In bloom indoors in February and March. Not entirely satisfactory outside.

IRIS ROBINSONIANA, "The wedding flower of Lord Howe's Island." There are several large three-year old specimens in pots, but so far they have shown no inclination to bloom. Who has bloomed it?

SARRACENIA PURPUREA, the common pitcher plant of our northern swamps. Some large clumps in pots reminded me of what an excellent plant this is for conservatory decoration, and too what odd and handsome flowers they bear. Get a lot of large, stocky wild plants and plant them singly in pots or several together in pans, well drained and in a compost of leaf soil and chopped fresh sphagnum moss. Water abundantly at all times. Keep the plants in a cold frame till Christmas or later, then introduce them into the greenhouse. In a few weeks' time they will throw up their bright yellow flowers and later renew their foliage.

GOLDFUSSIA (*Strobilanthes*) *ISOPHYLLA*.—Extremely floriferous acanthaceous plants with lavender colored flowers. Very pretty for conservatory decoration, but of little use for cut flowers. Easily raised from cuttings. One year old plants bloom freely, but two or three year old plants are the most copious.

CHORIZEMA VARIEUM.—These are neat dense bushy plants with red and yellow pea flowers in the greatest abundance. Years ago they were quite common in our greenhouses, but recently, although still in demand, we seldom find them. If well cared for plants will live for years,

LELIA ARNOLDIANA

but they bloom freely from one year old. Easily raised from cuttings or seed, but preferably, in the case of the finer varieties, from cuttings.

WINTERING NELUMBIUM SPECIOSUM.—Prof. Watson was a little troubled about how best to do this. He has it growing in a tank in the greenhouse and from which he runs off the water in winter, and the tank is now full of roots. But he tells me that before starting time in spring most all the roots in the middle of the tank will probably die out and only a few pieces near the outer edge of the tank be alive.

SALVIA GESSNERIFLORA and **S. Heerii.**—Both of these handsome scarlet flowering species were in brilliant array and furnished an abundance of a color which at this season of the year is rather scarce among our flowers.

FREESIA LEICHTLINII.—Prof. Watson seems to like this species better than *F. refracta*, it produces such stiff stems and handsome large flowers. Well, I don't. I don't get half the quantity of flowers from *Leichtlinii* that I do from *refracta*, and with me *refracta* is healthier, longer stemmed, more branched and earlier.

FINE FREESIA REFRACTA.—Prof. W. tells me of a neighbor of his whose *refracta* last year were two feet high and lots and lots of the sprays bore eleven to thirteen flowers a piece.

RHODOCHITON VOLUMBE was trained along strings under the roof. This is a soft-wooded, Mexican, *Lophospermum*-like vine that bears the greatest profusion of very dark purple, drooping, campanulate flowers whose beauty is enhanced by the bright yellowish white anthers inside the bells. Of no use for cutting, but a pretty plant for amateurs either indoors in winter or outdoors in summer. Increase from cuttings; it may also be grown from seed, but I seldom have got good seed.

EUPATORIUM TRISTE.—Under this name I found here and elsewhere around Boston quantities of a handsome white flowering form grown for winter blooms. It is in the way of *E. lanthum*, and has large corymbose heads of showy fragrant flowers. Worthy of general cultivation. But I am not sure about the authenticity of the name "*triste*," is it *E. Weinmannianum*?

SPARMANNIA AFRICANA appeals for recognition. It is a South African large-leaved shrub with large terminal bunches of showy white flowers with a prominent mass of purple, yellow tipped stamens in the middle of each. Propagated from cuttings. The plants live long and if encouraged grow large, and they bloom every year during the winter season, even one year old plants bloom nicely.

LOESELIA COCCINEA was in full bloom. It is a little Mexican plant with a profusion of scarlet flowers, but it is apt to lose a good many of its lower leaves, and very subject to red spider.

OLEA (OSMANTHUS) FRAGRANS.—Some bushes of this deliciously fragrant shrub were in bloom. It is an evergreen shrub, a native of Japan and China, and bears a great profusion of quite small whitish but delightfully fragrant flowers. It is not hardy here, but can be safely wintered in a cool pit, as it will bear 15° of frost with impunity. Much esteemed as a house plant. Some of our "mail" florists who retail large quantities of it have it propagated and grown for them in Florida.

OXALIS CERNUA, yellow, was the handsomest of its race in bloom. It is bold and copious and a deserving window plant. And there is a double flowering form which is not uncommon.

BEGONIA FROEBELI presented a cheerful aspect; its brilliant scarlet flowers and large handsome foliage spread over plush-like with bright purple hairs render it an

acquisition among ornamental plants. A native of Ecuador and esteemed in cultivation for its winter blooming nature. James Taplin when at Such's used to grow this fine species in splendid form.

ALLIUM NEAPOLITANUM.—Good plants in pots were in bloom and much appreciated. And I can recommend it. Although its leaves are long and somewhat limp it throws up stiff enough flower scapes and the umbels of white flowers are real pretty. And the bulbs multiply and bloom year after year even when grown in pots.

ARCUM DRACUNCULUS.—I noticed a lot of these in vigorous growth in pots, but not yet in bloom. It is a native of southern Europe and commonly known as the Dragon or Snake plant. It grows about two feet high and, usually in May, produces a flower in form like an enormous calla blossom, but of a blackish chocolate color and emitting a most powerful and abominable odor which, however, is intermittent.

HYBRID CHRISTMAS ROSES (HELLEBORUS).—Prof. W. had a group of these in pots and in fine bloom in a greenhouse; they consisted of hybrid forms of *H. Olympicus* and *H. Colchicus*. The plants were tall and leafy and the flower stems branched and the blossoms carried well above the foliage; some had crimson purple flowers and others white blossoms more or less dotted or streaked with purple. These plants are ordinarily hardy, but can only be had in perfection in winter when grown in frames or indoors just to save their flowers from damage on account of the vicissitudes of the season. Although good as cut flowers their great importance is as pot plants; they are showy, tough, hardy, long lasting and distinct from all other plants, and commercial florists appreciate them. Indeed President Calder of the Boston Gardeners' and Florists' Club, was very eulogistic regarding these same plants.

WINDOW PLANTS.—In the dining-room and parlors of Prof. Watson's residence are large bay windows and these are filled with many kinds of plants; the windows of his upstairs rooms are also furnished in the same way. In the rooms, as the dining and sitting room, that are kept moderately warm, *Ficus elastica*, several palms, a large *Musa ensata*, large leaved begonias, *Grevillea robusta*, *Nephrolepis exaltata* and *N. tuberosa*, Chinese narcissus and other seasonable flowering plants are grown. In the hallway columnar Irish yews in narrow tubs keep guard, and in the cooler parlors and other rooms the laurustinus is in bloom and associated with it are the Portugal laurel, English holly, New Zealand flax (*Phormium*), *Ilex* "*Japonica*," *chamerops*, palms and the like fill up the space. Masses of Christmas roses in pots are also freely used. Prof. W. speaks very highly of the above ferns (*Nephrolepis*) and the New Zealand flax as window plants. During the chrysanthemum season he had some of his bay windows filled with them, and now he is preparing a lot of hydrangeas in the greenhouses to bring in for effect in spring.

Violet Crops.

Under the head of Chicago, on page 268 of January 15 issue, is given the number of violets cut from a house of given size in a given length of time, by Mr. Geo. Klehm. I was glad to see this report as such data is both interesting and valuable. Although I have been growing violets for a number of years, I have never before seen a report of the number

of blooms picked from a given space. However, I can make a better showing than George. I have a bench 4x100 feet from which I picked 10,550 violets from November 1, '89 to January 17, '90. I might further say that 3,800 of these were picked from December 23 to December 31, '89, and so came in very nice for the holidays. H. DALE.

Brampton, Ont.

Souvenir de Wootton.

This rose like all new roses has its friends and enemies. Difference in soil, location, methods of culture, etc. generally bring about this result. To produce flowers of fine form, and in profitable quantities, requires a special study of this or any other rose. The small sized flowers that are put on the market and the murmurs of dissatisfaction heard on every hand are chiefly due to a lack of acquaintance with the rose. No one can justly expect to attain the best results with a few small plants, put into and grown with a house of Mermets, Niphets, etc.

The Wootton requires different treatment from that given the true tea roses, in fact it must be grown separate from other roses. No doubt by some lucky chance some growers may have succeeded in growing it in good shape in any house, but this has been the exception.

The Wootton is a very free blooming rose. The color when well handled commands attention at once and in fragrance it ranks A 1. It should be planted early and induced to make strong growth; the wood should be well ripened and treated cool when starting for winter flowers. It is almost as impatient of heat as any of the H. Ps. Heat diminishes the size of the flowers and injures the color, as also will smoke. As a cut flower rose from November 1 until March 1 there should be a place for it where any one can devote an entire house to it and give it the special treatment it requires.

We can not expect everything in one rose. The perfect rose is not yet in sight. CHAS. P. ANDERSON.

Flushing, N. Y.

—In reply to your inquiry regarding Souvenir de Wootton, I would say that my opinion of the rose as grown on Long Island is as follows:

The rose is a strong robust grower and free bloomer, foliage and growth resembling very much that of Bon Silene, but far more vigorous and less liable to mildew. I have so far seen no black spot on the leaves, nor should I consider the rose from its habit subject to that fungus.

As to the flower of the Wootton and as to its selling qualities, I do not think the rose has been given a sufficient trial for any one to be able to say with certainty much regarding it. The rose is a great bloomer and can be classed as a rose that it would pay to grow for the same price as Perle des Jardins. Its greatest fault lies in the fact that its brilliant red color fades soon after cutting to a dull red, and when a day old has much the appearance of a faded flower. The average bloom with me is about the size of a good Perle

des Jardins, with a few flowers from stronger wood nearly the size of an American Beauty when fully expanded.

It is a very poor fall rose, as the buds come small, although they may improve with better plants.

I think there is too much that is good in the rose to discard it on a first trial. Another year ought to show whether it has a place among our commercial roses or not. JOHN H. TAYLOR.

Bayside, L. I.

—Regarding the "Wootton" rose I would say that in my case it has proven to be one of the most profitable roses of the season. It has been very free in blooming, the buds have generally been of a good color with nice long stems, while the plants are and have been all the season the healthiest and finest on my place, never having once been attacked by black spot, mildew or any other disease. W. W. COLES.

Lansdowne, Pa., February 6.

Notes at West Hoboken—A Good Word for Wootton.

At Ernest Asmus' immense range of greenhouses at West Hoboken may be seen the rose Madam Cusin at its very best. Its freedom of bloom is phenomenal, while the size and color are a revelation to one who has only seen it in the west where it is rarely grown and still more rarely well grown. It is high time western growers woke up to the great value of this rose which has been extremely popular and salable in New York and other eastern cities for some years.

Mr. Asmus in common with most of us has been finding Perle des Jardins less and less satisfactory year by year, and is now largely substituting Madam Hoste, which, though lacking the strong color of Perle, seems in every other respect much more desirable, and experience has already shown that its pale color is no bar to its ready sale as was at first feared.

Only a few Woottons have been grown here as yet, just enough to try, but these few have done remarkably well, and show a smaller percentage of poor flowers than at any place the writer has seen. It seems probable that many who have grown this rose for the first time this winter, have been in too great haste to condemn it. They started out with extravagant expectations of something rivaling American Beauty, and being disappointed in this, at once set it down as a fraud. The fact is the Wootton has been handicapped by being entered in too fast a class. Just enter it in the Papa Gontier class and give it another trial; it will probably prove to be a rose well worth growing after all. R.

Notes at Bayside, L. I.

I went out to Bayside recently primarily to pay a visit to Mr. Taylor (in which I was disappointed, he being away from home), and incidentally to see his roses, especially those Meteors we have been reading about. The Meteors were not away from home, they were right there attending to business, in good bloom, of fair size and most excellent color. It is truly surprising, the things some folks can do that other folks can not get the hang of. Why, even brother Gurney Hill who grows plants of Meteor for sale can not find it in his conscience to recommend it as a forcing rose, and yet behold here it is, forced quite satisfactorily. I think it must be admitted as beyond question that growers on the Atlantic coast get more sunshine in the early winter months

than we in the west are favored with. Roses like Madam Watteville for instance, that are known to require plenty of light seem to be forced profitably in the east, and have, so far as I know, proved quite a failure west.

Mr. Taylor's "Cyps" referred to by a recent correspondent as being partly cut off for Thanksgiving are still holding their own over about one-third of the house and look as if they might keep till Easter if wanted. It really looks as if these cypridiums should be taken out of the category of perishable commodities and classed with shelf hardware, to be kept until sold. R.

Fuller's Rose Beetle.

(*Aramigus Fulleri*, Horn)

Among the many greenhouse pests which are a source of constant annoyance to the florist, the so-called Fuller's rose beetle (*Aramigus Fulleri*, Horn), stands near the head. Its little known habits make it, to the florist, like "an unknown evil in the dark." He kills the insect when he finds it, but in the majority of cases his plants continue to wither and be defoliated and the blossoms eaten out. As it is such a pest and spreads so rapidly over our country, it would be well to consider, briefly, what is known of it and the methods of extermination.

Fig. 1. Beetle.

This beetle (Fig. 1) is a weevil, of a black color, covered with dark brown scales and about eight millimeters (5-16 inch) in length. The abdomen is oval in shape and the thorax quadrate, while the head, which is about the length of the thorax, extends obliquely downwards. The eggs are oval in shape, smooth and yellow. Dr. C. V. Riley, the United States Entomologist, in speaking of the eggs and larva of this insect, says: "The female shows a confirmed habit of secreting her eggs, which are thrust between the loose bark and the stem, especially at the base, just above the ground. These eggs require about a month to hatch, and the new horn larva which is of a pale yellowish color with light brown mouth parts, is quite active and immediately burrows

Fig. 2. Larva, after Riley.

into the ground and acquires very soon after a bluish hue. Just how long this larva (Fig. 2) requires to attain full growth I have not been able to ascertain, but in all probability it remains at least one month, and probably several more in the ground, where the pupa state (Fig. 3) is finally assumed." The root eating habits of the larva render it very difficult to combat, as its presence is very seldom indicated by any outward appearance.

Should a plant begin to fail from some unknown cause the roots should at once be thoroughly examined. If any are found at all it will probably be in some considerable number. It is very evident from the life of the larva that our efforts should be, for the great part, directed against the mature insects.

Reports from a number of florists would seem to indicate that this insect directed its attention more to roses than any other greenhouse plant. Mr. Louis Knapper, florist in the greenhouses of the Michigan State Agricultural College, states that his experience has been, that although for a number of seasons these insects have occurred there in considera-

Fig. 3. Pupa, after Riley.

ble numbers, yet among a large number of roses not one had been injured by the larva, and only one variety (the bridal rose), in one instance, had been known to be damaged by the imago. In the above named greenhouses the greater part of the damage done was by the imago to the foliage of large hard wood plants. During the last fall an acacia was so stripped of its foliage that it died, and an orange tree was also very badly injured. Other plants on which it had been working were the palm, dracena, fig (ficus), camellia, sylvia, mespilus, a number of grasses, bridal rose, brodiaea, hibiscus, eupatorium, habrothamnus, olive (olea), viburnum and wall-flower. It has been observed in California as attacking several plants, among them the dracena, orange, Cape Jessamine (gardenia), and achyranthus, feeding on their outdoors. If it is liable to become troublesome to the orangegrowers steps should at once be taken to make a complete investigation of its life history and habits, and the best means of exterminating it, for the method usually applied in the greenhouse could not be applied equally well in the orchard. The greater part of the damage is done during the night, the insect during the day resting quietly on a twig or branch, or between the petals of a flower.

As one of the means of ridding the greenhouse of these insects, hand picking has been recommended. Those who have tried this method will support me in saying that it is very tiresome, unsatisfactory work, and takes more time than the average florist has to give it. The beetles being about the color of the twig or branch on which they rest, or being hid deep down between the petals of a flower, are most difficult objects to find. Another much easier method and one that will occupy much less time is jarring. A large piece of white cloth or canvas, such as is often used by the florist, should be spread on the table or floor and the infested plants in their pots jarred over it. If not in pots the cloth or canvas may be spread under them around the stem. The jarring is accomplished by giving the stem a quick sharp blow with the hand, or with a stick on which cloth has been wound. This method, of course, applies to the mature insects only. Before jarring the plant should be handled carefully and not unnecessarily agitated, for when alarmed the beetles do not fly, but only cling the tighter to their resting place, or let go their hold and drop. They are most admirably adapted for "playing possum," for when lying on the ground or in a pot of earth with their legs drawn tight to their bodies and their antennae folded in they can hardly be distinguished from a ball of earth. A very plausible method of preventing the damages done to the roots by the larva of these insects has been suggested by Dr. C. V. Riley. He says: "I would recommend as an effectual preventive measure the tying of a few thicknesses of tape, or of narrow pieces of rag, or even of stiff paper around the butt of the plant to be examined, detached every three weeks and burned if eggs are found in them. When the number of plants is large this destruction of the eggs might be expedited by the employment of traps, consisting of small stakes around which such layers of cloth or paper are tied. These should be thrust in the ground near the main plant and can be collected once every three weeks, thrown into a tub of hot water, subsequently dried and used again without untying the bandages. A few folds of oil paper thrust into a slit in an ordinary wooden label—materials

always at hand in a greenhouse—might also be advantageously employed." It is very probable that spraying with London Purple might be carried on with success in this instance as it is with the plum curculio and other nearly related insects. If this remedy be used it should be in the proportion of one pound of the London Purple to two hundred gallons of water. A stronger solution should not, as a general thing, be used, as it might possibly ruin the foliage of the more delicate plants.

M. A. C., Jan. 20. CHAS. F. BAKER.

A Root Cellar.

Our root cellar is a temporary structure or pit made of posts and old boards banked with earth and rendered frost proof by covering on top. The bottom is 3 feet under the ground level. It is a lean-to structure, facing south, back is 7 feet high, front 5 feet high, and it is entered by a door at east end and ventilated by a window at west end. The drainage is perfect. The roof is lined with old boards over which tar paper is tacked and held in place by strips of bass-wood. Against the back, front and ends we bank up the earth in winter and lay a

SECTIONAL VIEW OF A CHEAP ROOT CELLAR MADE OF OLD RAILROAD TIES.

lot of thatch on top of roof and hold it in place by brush. This renders it perfectly frost proof, and by using the door and window we can keep it pretty uniformly cool. In spring I remove the thatch from the roof, then lay some tall brush leaning against the sides of the pit all round and sow scarlet runners and nasturtiums along beside the brush. These soon grow up a mass of vines and blossoms and the runners particularly keep green and fresh all summer. Inside there is a 20-inch wide pathway along the back, and from the path to the front wall the space is divided into 2 feet and 3 feet wide bins with a 3-inch wide empty space between the bins.

In this pit we store our roots as potatoes, carrots, parsnips, beets, salsify, etc., and they keep splendidly. And we also keep in it a good many miscellaneous flower roots.

The main points to be considered in such a pit as this are perfect drainage, a regular low temperature without admitting frost, a sweet atmosphere caused by ready ventilation if needed, and security from drip and vermin.

In mild localities as ours here an extra deep pit is not necessary, for it be remembered that while the deeper the pit the warmer and more equable it is in winter, it is also apt to be damp, but in rigorous localities the deep pit is the most desirable.

For the general florist such a pit is very useful as he can store a large quantity of stuff in it over winter. He can keep his potted bulbs in it till he is ready to bring them indoors for forcing. He can store his common cannas and Madeira vine tubers in it, but he should not trust calladium or gloxinia roots in it. He can winter all manner of evergreens that he uses in his business, but which are too tender to leave outdoors without protection, for instance, Portugal and Span-

ish laurels, bay laurel, laurustinus, English hollies, Japan privet (Ligustrum Japonicum), finer hybrid rhododendrons, araucarias, camellias if necessary, and several others.

And among deciduous shrubs as crape myrtles, azaleas, figs, lemon verbenas, hydrangeas, pomegranate and the like can be safely kept, so too can pampas grass, bamboos of the aurea and metake order, tritomas, aspidistra and others. And if kept up off the ground and quite dry the stronger agaves live well enough in such quarters.

It is a good place to keep a stock of lilacs, snowball, crabapple and other potted shrubs to be in readiness for forcing. And if one receives a consignment of roses, clematises or other outdoor plants in winter time such a pit is a capital place to store them in till it is safe to plant them out of doors. In fact a pit of this sort can be used for most any purpose that a cellar or shed can be used for in the way of storing plants in, with one advantage over them, namely, uniformly low temperature, and one disadvantage to wit, probable dampness, but ready means of ventilating will remedy this.

Glen Cove, N. Y.

W. F.

—Our sketch gives a sectional view of a cheap root cellar of small size made of old railroad ties, built by Mr. Geo. Klehm, a florist at Arlington Heights, near Chicago. Where such material can be obtained the cost is usually very slight and it can be used for this purpose to splendid advantage. The cellar in question is ventilated by small openings at the apex in which are inserted short sections of terra cotta pipe. He uses it mainly for holding bulbs which are to be forced, but he finds it extremely useful in many other ways and believes that no florist can afford to be without a convenience of this kind, especially in view of the very slight cost.

Asparagus Tenuissimus.

That we do grow and sell asparagus, after all that has been said against it when a few years ago we first got it, is an undisputed fact now and I am inclined to think the principal objection against it was in the vegetable name, but the anticipation of some very sanguine admirers of it that it would in time take the place of smilax, was not realized, for smilax is as much in demand now as ever it was and will be for years to come. But I think the asparagus also has come to stay and a few hints on its cultivation may benefit some of the brotherhood.

To grow this most useful vine requires no more skill than it does to grow good smilax, nor does it require more labor, but plants should be planted a little further apart in the bed, for they will after the first cutting down send up a number of new growths which could not be kept in their respective places close to the strings if no more room was allowed than we generally allow to our smilax. When planting a new bed it should have perfect drainage as the first requisite and from one and a half to two feet of good rich soil, rather light and sandy so as to let the water soak through freely. If we see this asparagus occasionally in a feeble state, looking yellowish and not making vigorous growth you may be sure that the soil is not porous enough and drainage not perfect, the soil is getting sour and this is what the plant dislikes. In a healthy bed the roots will go away down, how deep I do not know, but in digging up an old bed last summer we found plenty of roots two feet below the sur-

face, but did not dig down any further to find out how deep they actually would go. It is well known to every one in the trade that we propagate it by cuttings, but I would advise any one contemplating to grow it for market to set out strong plants, one year old at least for a beginning, because these will run up directly to the end of your string or beyond, while younger stock would require months before they could gather strength enough to make even an attempt to run up three or four feet. Keep the bed well watered without actually soaking and give plenty of air in warm weather, no shading is required in the hot summer months if a daily syringing is administered. Unlike smilax it flourishes best under the full force of the sun and therefore should have all the light possible, especially during the winter months.

Once planted a bed will last a number of years in healthy condition, but we must either top dress or feed with liquid manure freely after the first season and when the plant stools become so matted as to run into each other every second plant may be taken out in order to allow more strings to the now very numerous growths springing from the plants. I would rather not run a bed any longer than four or five years without renewing the soil and would prefer younger plants grown in pots to the old stools for replanting, as some have recommended.

Asparagus plumosus will stand the same treatment, but as it is a much more rampant grower should have more room accordingly. JOHN B. KELLER.

Rochester, N. Y.

Notes From the Arnold Arboretum.

About ten minutes' walk from Forest Hills station brings us to Mr. Dawson's house, where we experience the genial hospitality peculiar to our host and his family. Under the drenching rain we forgo a ramble through the arboretum and nursery grounds, for these can only be seen to advantage in summer. In the home nurseries most of the young and new plants are mulched over in beds or covered up in deep pits. But propagating is always in order in the greenhouse.

A NEW ACACIA.—Mr. Dawson had a very beautiful acacia in bloom, it was one year old from seed, about 2½ feet high, bushy but graceful and covered throughout with bright yellow, small round flower heads. The foliage is in the style of *A. Farnesiana*, but smaller. It is a native of Western Australia. Its beauty, free growth and abundant and early blooming nature impress him very favorably.

SOME GOOD LILACS.—Mr. Dawson gives me the following as being, all points considered, about as good a selection as one need make: Dr. Lindley, Philemon, Chas. X., Marie Legraye and *Vulgaris alba*.

ZANTHOIRHIZA APIFOLIA.—This, the Shrub Yellow Root of the Alleghenies is a neat low growing spreading shrub, that in early spring bears a multitude of compound racemes of dark purple flowers. Mr. Dawson is growing a large quantity of it for planting on banks and slopes. It thrives in ordinarily moist and faintly shaded places and I have found it quite hardy as far north as Boston.

THE CALIFORNIAN CROWFOOT (*Ranunculus Californicus*).—Mr. Dawson has it in good bloom in pots in the greenhouse. According to Serceno Watson "This is by far the most common and abundant species in the State (California), and is particularly abundant in the coast ranges

where low grassy hills are often yellow with the shining flowers in early spring." About 15 to 18 inches high, with branching stems, divided leaves and many showy buttercup blossoms. But suitable only for amateurs.

A GORGEOUS FLOWER BED.—Nothing in the neighborhood, Mr. Dawson tells me, excited so much admiration as a bed of composite plants that he had made last year alongside of a board fence and running up to the road. The bed was 50 or 60 yards long and about 10 feet wide and filled full with all manner of sun-flowers, helianthus, veronias, silphiums, heliopsis, boltonias, asters, solidagos and other composite plants; they had been planted thickly, the taller growing species to the back and the shorter ones to the front, and allowed to grow up altogether and interlace among each other. Most all of them were luxuriant growers and late and showy bloomers, and in fall the whole formed a dazzling bank of purple and gold that fixed the attention of every passer by. W. F.

How and Why Some Men Make Money and Others Do Not.

Men who make money in any business do so by correct business methods, not by being slipshod in any particular. Go into any successful merchant's store and you will find there some sort of a system in operation. So it is in any kind of business. If you do not find it you hear the proprietor complain of dull times, or something else, and in nine cases out of ten can look for his failure.

Now take our florists and nine-tenths of them keep no books of account in any form, their places are dirty and half full of litter, their stock below the standard and they complain that times are dull; in fact, there is a lack of system.

If you do not keep accounts how do you know whether you are making or losing? Can you tell whether you have made or lost on any particular line? Can you tell whether it is best to keep a certain line or "heave it out"? No. You have no system and that is what is the matter. You try to do too much with too little. You can not grow all varieties of plants in one house with the same treatment.

There comes to my mind two or three cases which bear on this matter, viz: One party is growing roses for cut flowers and he is making money. Why? He has a system of doing his business, and he tends to business. Another is growing nothing but pinks. He gets more than other growers, for he pays particular attention to his line and nothing else, and he has a system of doing business. So is a man who is growing plants. He grows a few kinds that require very similar treatment in one house, others in another and so on, in fact, he has a system. He also keeps a set of books and could tell you, I doubt not if he chose, whether he made or lost on any particular line last season or not, thereby enabling him to tell what to grow and what to let alone.

On the other hand there are as many others who are always complaining of dull times and who say there is no money in the business. Let us look into their houses. We find cut flowers, stock plants, bedding plants of all kinds and everything else all huddled up in one house and all getting the same treatment, in fact, no system. Ask one of them whether he made or lost money on any particular line and he can not answer you. He don't keep any books. How can he? In

fact, he is growing stock helter-skelter without any regard either for the plant, his business or his customers.

We are all of us looking for "the great American dollar," and to get it we have got to have some kind of a system of doing business, and when we get one tend to business; and also we have to have some way of knowing how and where we stand.

Take this subject into consideration, run over the list of your acquaintances and you will find that the mark aimed at is not so far off as you imagined. It may be yourself. At any rate commence there first.

ALFRED B. COPELAND.
Springfield, Mass.

Improvement in Greenhouse Flues.

The improvement in heating greenhouses has been great of late years, but I think the benefit has been far more to the large commercial grower who can command a large capital than to the small florist whose means are limited and whose resources must needs be husbanded and every dollar made to bring its due reward. I also think many small growers have been induced to change from flues to hot water or steam, whose money so spent would have paid them greater returns invested in more glass. I must also insist on what I believe to be a fact, that the new arrangements are no more economical of coal (and not always of labor) than the old fashioned flue.

Many may think the flue has had its day, but this is a great mistake. For the florist with his few thousand feet of glass there is nothing more economical, cheaper in first cost, or more effective than the same old fashioned greenhouse flue. It has its defects I am aware, but they are such as to be easily overcome, and the attention required to keep them in proper order and trim and the watchfulness needed in managing the plants of a house so heated is a great element in the success of the small florist. With the improved systems the plants often suffer from this want of acquaintance. I might say, too much being expected of these improvements. There is no system that can dispense with the watchful care of the careful hand.

One of the greatest defects of the flue system is the unequal distribution of the heat. This is partially overcome when two or more houses adjoin by placing the furnaces at alternate ends of the houses, or in case of a long house, at both ends, or a large brick drum at the end opposite the furnace is occasionally used with some measure of success.

Now it seems to me that the flue has been greatly neglected, or perhaps it has been thought that since Mr. Peter Henderson suggested placing the chimney over the furnace the acme of perfection had been reached. This indeed is an excellent arrangement, and all flues should be constructed on that principle when possible to do so. But my object in writing this paper is to describe a method that will more than double the usefulness of any flue and probably save some coal into the bargain. It is simply a water-back placed in the flue working exactly on the same principle as a water-back in a kitchen range.

The device as used in my propagating house (70 feet long) will be better understood by referring to the accompanying drawings.

Fig. 1 represents the elevation and Fig. 2 the plan; aa is the bench; bb the floor of house; c the furnace; d the brick flue; e the terra cotta, and f the chimney. The

Fig 1.

Fig. 2.

IMPROVEMENT IN GREENHOUSE FLUES.

return pipe, h, starts from the bottom of the small tank, g, which may be placed at any convenient point on the bench.

It drops some 18 inches and makes a bend to the front having a gradual fall to the point i, where it makes a turn into the flue at the bottom. After entering the pipe makes another turn along the bottom of the flue still falling to the point j, running 16 feet within the flue, then rises and turns back along top of flue to k, leaving flue at that point by a turn and short rise. Bending again the pipe continues to rise to the tank as shown; this portion being the flow. A coil, l, l, Fig. 2, is inserted in the flow and in this there is a turn for 12 feet back, then 12 forward, 6 back and 6 forward and up to tank.

In this water-back we have a perfect circulation of water. The hotter the furnace the greater the circulation and the more heat conveyed from the furnace to the other end of the house. The whole arrangement is made out of 1-inch wrought iron pipe with the appropriate couplings and put together by ourselves, the plumber near by cutting the pipe for us. The pipe was second hand and cost but 6c per foot. The tank is a 15-gallon paint keg cut off at top to fit in under the glass.

The whole arrangement did not cost \$3 and the result is very satisfactory. Before the pipes were put in there was a difference in temperature between the two ends of house of 15° to 20° on cold nights. Now there is practically a uniform temperature excepting immediately near the furnace. Besides it gives us a very uniform and gentle bottom heat for our cutting bench along its entire length. I believe this principle is capable of extended application.

It is obvious that the pipes can be led to any point of a house and in any manner desired having the coil or coils where they will best equalize the temperature. The flow may be led overhead, under the bench, or even carried into an adjoining house. The small tank can be placed in the comb at the end of a large house, or in any position where most out of the way. Attention must be given to keep it full of water, as when firing strong several inches will evaporate from it in a night. If made of boiler iron and a simple safety valve attached the water could be circulated under pressure and the apparatus perhaps prove more effective. The evaporation from the tank also furnishes the needed moisture in an effective manner, at least to that end of the house.

It is not necessary to follow the construction shown in cuts. The water-back may be placed nearer the fire—a chamber being constructed at the neck of the furnace to accommodate a coil—this coil of course to be placed below the rest of the system. In fact, my neighbor, Mr. Chas. T. Starr, has a house heated by a coil placed within the furnace, but in his case 4-inch cast iron pipes are used for flow and return. I consider the small sized pipe preferable, being cheaper and the circulation quicker, heating up or cooling faster, a desirable advantage. Besides the large pipe would be impracticable in my case, being too large for an ordinary flue. The 1-inch pipe is no impediment to the draft.

In using a water-back as I have described, I think at least one third the terra cotta might be dispensed with and the money thus saved would nearly or quite pay for the entire improvement. However, I would recommend that 1-inch galvanized pipe be used, which would cost new 11 cents per foot. It would take 150 to 300 feet of same for a house 60 feet long, together with the necessary bends and couplings. A spigot should always be provided at the lowest point for drawing off the water.

There is nothing patented or patentable about this affair, so that I have no further motive in writing it up than the simple desire to have others benefitted by it in the same manner it has thus far benefitted me. W. R. SHELMIER.

Avondale, Pa.

News Notes.

ROCKFORD, ILL.—J. J. Soper has built a new house 100x20.

NEW ORLEANS.—The New Orleans Hort. Society has issued the premium list for the coming April exhibition.

EAST SAGINAW, MICH.—A. Grohmann & Sons have finished their new store and greenhouse at 317 Fitzhugh street, which will be run in connection with their old place two miles out of town on Saginaw street.

JOHNSTOWN, PA.—Adolph Stahl, formerly with H. A. Dreer, has formed a partnership with Andrew Akers, son of the late Alvar Akers, of this city, and the business will be continued under the firm name of Akers & Stahl.

HARRISBURG.—John Loban, Sr., the state florist, died January 1 from a com-

plication of pneumonia, heart and brain trouble. He was in his 70th year. He has been the state florist for twenty years and was well known. He leaves a widow and three children.

WILKES BARRE, PA.—Chas. E. Stenson, who has been in the employ of B. F. Dorrance of this city for five years, has rented the greenhouses and office of Barton Bros., Uniontown, Fayette county, Pa., and will continue the business formerly conducted by them.

NEW YORK.—Thomas T. Carr, the Sixth avenue florist, has purchased the old bank building at the corner of Thirty-fifth street and Sixth avenue for \$57,000. Florist Charles Thorley is reported to have had about \$4,000 on deposit with the Sixth National bank which has recently closed its doors. The bank will probably soon resume and the inconvenience to depositors be only temporary.

INDIANAPOLIS.—The fourth annual meeting of the Society of Indiana Florists will be held in this city February 26 and 27, at the State House. A railroad rate of one and one third fare for the round trip has been secured for those attending. A number of essays upon subjects of interest will be read before the meeting in addition to routine business, and a reception and entertainment will be given to the members the evening of the first day.

HORNELLVILLE, N. Y.—The date of the death of A. J. Plimpton should have been given December 18 and not January 18 as given in your former issue. Mr. Plimpton has been in the greenhouse business since 1867, having established the first one in the county where he resided. He was well known in Western New York and will be greatly missed by a large circle of business and private friends. G. R. M.

BALTIMORE.—A certificate of incorporation of the Florists' Exchange, of Baltimore City, was filed for record in the clerk's office of the Superior Court February 1 by Isaac H. Moss, John Wiedy, William McRoberts, Jr., and William Feast, of Baltimore county; Edwin A. Seidewitz, of Anne Arundel county; Robert J. Halliday and Charles G. Campbell, of Baltimore City. The purposes of the corporation are for procuring and preparing for market, and buying and selling trees, plants, seeds, fruits and flowers, roots and other products. The capital stock is \$5,000, divided into 1,000 shares.

42 W. Main Street, ROCHESTER, N. Y.

ROSE BUSHES FOR FLORISTS.

Contracts made now at very Reasonable Rates for any of following Roses from 2 1-2 or 3-inch pots, for Delivery by May 15, 1890.

WE SHALL HAVE THEM BY THE MILLION.

NEW ROSES:

Wootton,
Duchess of Albany,
Madame Hoste,
Luciole,
Watteville,
And all the New
varieties of 1889.

OLDER VARIETIES:

Perle,
Puritan,
Bride,
Mermet,
La France,
Papa Gontier,
Cusin.

Our Rose Buds of WOOTTON and all above varieties are very good now.

Telephones 977 and 999.

C. STRAUSS & CO., WASHINGTON, D. C.

P. O. Box 422.

ROSES.

Healthy young plants in 2 and 2½-in. pots.
Perle des Jardins, La France,
Niphetos, Catherine Mermet,
Sunset, Safran,
The Bride, Papa Gontier,
Cornelia Cook, Isabella Sprunt,
Bon Silene, Ophelia,
Sombreuil, Malmaison,
Souvenir d'un Ami, Etiole de Lyon,
Mme. Scipion Cochet, Duchess de Brabant,
Arch Duke Cochet, Marie Guillot,
Marie van Houtte, La Princesse Vera,
Dr. Grill, Mme. Welch,
Luciole, Mme. Lambert,
Bosanquet, Musk Cluster,
Adam Tea, Lawencia,
Duchess of Edinburgh, Homer,
La Pactole, Louis Philip,
Mme. Margottin, Mlle. F. Kruger,
Honorable, Edith Gifford,
Caroline Kuster, Agrippina,
Empress Eugenie, and other varieties. Price, \$4
per 100; \$35 per 1000.

Mme. Charles Wood, Magna Charta,
Paul Neyron, Queen of Bedders,
Gerard Des Boies, Jacqueminot, \$5 per 100.
Large plants of the above named varieties, \$15
to \$18 per 100. ADDRESS

A. LAUER,
1210 East Broadway, LOUISVILLE, KY.

ROSES.

A very large stock of young Roses of the leading bedding and forcing varieties. Also large stock of same in 3 and 6-inch pots.
The best and newest of CHRYSANTHEMUMS, CARNATIONS and general greenhouse stock.
Trade list mailed on application.

JACOB SCHULZ,
Louisville, Ky.

H. P. AND MOSS ROSES.

2 years, out of open ground, \$30.00 per 1000. Moss, \$10.00 per 100. Tea Roses, out of 3-inch pots, \$1.00 per 100.

If you need any stock, write for it. I will sell at your own prices, if not too low.

SCIENTIFIC EDUCATION FOR FLORISTS.

Unpleasant as it is to admit it, still it must be confessed that there is a great deal of cold truth in Mr. Taplin's remarks regarding the possibility of securing government aid for the establishment of such a school as that desired. If we ever have such a school—where the curriculum shall be confined mainly to those special branches of the sciences which bear particularly upon our profession, it will probably be established by those in the trade for the benefit of the coming generation. Is there not some one in the trade possessed of sufficient wealth and interest in the future welfare of the profession to endow such an institution and thereby leave a lasting monument to his name.

Such a school properly directed is undoubtedly what we want, but it will be realized, if at all, only in the distant future, and in the mean time something is wanted for the young men of the present generation, and wanted now. We believe that our correspondent J. H. H. hit the target close to the bull's eye in his communication under the heading of "Education wanted," on page 204 of our December 15 issue. Many may have thought that the communication in question was written by some well educated man for the purpose of discussion, but such is not the case. It was a genuine appeal from a young man of limited education for information as to what he should study to receive the most benefit, and we have been anxiously looking for replies from our readers who have given the matter thought and who have some familiarity with the subject. Such an appeal should not be ignored. It is such men as our correspondent that we should aim to help above all others, for he has a solid foundation to build upon—a thoughtful mind and industrious disposition, and without these essentials in the student instruction is largely wasted.

The young man who is going around with a great big interrogation point in his brain is the one we can help and help now. And if there is enough of the interrogation point, coupled with industry, he will get there all right if you will only properly direct him that he may not expend his effort in the wrong direction and become discouraged. This can be given now and there should be no delay. The pages of the FLORIST are open for suggestions, and for articles upon scientific subjects related to practical work. And lots of young men with an abnormally large development of the interrogation point are ready to receive the benefit. They have noted effects and are anxious to learn the cause. Give them the tools to work with and they will soon be solving problems for themselves.

IT WILL BE hardly necessary for us to say that we are heartily in accord with

Mr. Copeland in his pointed article upon "How and why some men make money and others do not." The FLORIST has time and again called the attention of the trade to the necessity of better business methods than those now existing, and to the almost entire absence of system in a large majority of greenhouse establishments. Have you taken advantage of the many valuable suggestions which have been made in these columns? Do you know what it costs you to produce each of the plants and flowers that you grow? If you do not how can you tell when you are selling them for less than they cost you? Are you working intelligently or are you groping in the dark?

NOMENCLATURE.—As will be seen by the communications in another column new life has been infused into the S. A. F. Committee on Nomenclature, and it is to be hoped that every member of the trade will feel it his duty to assist the committee to the full extent of his power. The necessity for work is admitted by all, a practical plan for making the work effective has been presented, and with the assistance of the trade in general it will be executed. Will you do your share?

RAISING NEW VARIETIES.—We learn that the set of seedling carnations raised by Mr. Fred Dörner, La Fayette, Ind., and recently commented upon in these columns, has been purchased by Messrs. Hill & Co., Richmond, Ind., for \$500. There is profit as well as satisfaction for the grower of improved varieties.

SPECIMEN BLOOMS of a seedling carnation from Garfield N. E. G. Hill, has been received from Nathan Smith & Son, Adrian, Mich. The color is good and it is extra large in size, but it bursts the calyx badly.

WE HAVE in hand and shall publish in next issue interesting papers read before the Florists' Clubs of Boston and Philadelphia.

OUR NEW DIRECTORY of the florists, nurserymen and seedsmen of the United States and Canada is now ready. Price \$2.

Catalogues Received.

Letter From Mrs. Henderson.

Secretary Stewart sends us the letter received from Mrs. Henderson in acknowledgment of the floral tribute sent in the name of the national society to the funeral of the late Peter Henderson. We give it below:

ARLINGTON AVE., JERSEY CITY HEIGHTS.
Society of American Florists.

Allow me to thank you for the beautiful token of esteem which you sent in remembrance of my late dear husband, Peter Henderson. I can not put into such heartfelt or eloquent words as he could have done, our great appreciation of your kindness.

I remain very gratefully however,
Yours sincerely,

JEAN H. HENDERSON.

January 22, 1890.

Peter Henderson's Will.

The will of Peter Henderson, the millionaire florist, who died at his home in Jersey City a few weeks ago, has been filed at the office of the Secretary of State and has been admitted to probate by the Chancellor in his capacity as ordinary. The will gives to Mr. Henderson's widow the homestead on Arlington avenue, Jersey City; the household goods, stable, carriages, horses, etc., \$30,000, the royalties and income from the several works he published and \$3,000 per annum, and charges the annuity against the rents of eleven houses enumerated. He gives to his son Alfred the store No. 37 Cortlandt street and the land on which it stands, and to his son Charles the other half of the double store No. 35 Cortlandt street with the land. His gift to his daughter Isabel, wife of Robert M. Floyd, is 18 houses on Union street, Jersey City. At her death one-third of the property goes to her daughter Ruth, and the other two-thirds are divided between his sons, Alfred and Charles. The executors are directed also to set apart and invest \$30,000 and pay the income to his daughter Isabel. He also stipulates that she is to receive \$25,000 within two years.

He gives to his two sons his seed business and the use for ten years of his plant and florist business on Arlington avenue, Jersey City. The residue of the estate is to be divided equally between his three children, the two sons to have their share without reserve, but the daughter's is to be held in trust, and she is to receive the income. The executors are his sons, Charles and Alfred. The will is dated July 12, 1889, and was witnessed by ex-Mayor Collins and his law partner, William H. Corbin.—*New York Herald February 2*

LATE CHRYSANTHEMUMS.—On New Year's eve we cut three dozen very fine Mrs. F. Thompson chrysanthemums; on the 8th of January cut some very fine Elks Horn, and on the 18th cut the last of Mrs. F. Thompson. How is that for Western Kansas? S. H. B. Abilene, Kan.

YOUR SPRING TRADE LIST should be published in this paper, to do you the most good. And the cost will be less.

Re Seed Trade.

SEED TRADE ASSOCIATION.

H. W. JOHNSON, Philadelphia, president; ALBERT M. McCLELLON, Cincinnati, secretary and treasurer. The eighth annual meeting at Saratoga Springs, N. Y., June, 1890.

Mr. J. E. NORTHRUP has returned from California.

SANTA CLARA, California seed firms are reported to have suffered by recent floods.

R. T. THOMPSON, proprietor of the Island Seed Company at Muscatine, Ia., died February 1.

THE MAIL TRADE with those strictly in vegetable seeds is reported so far no better than last year, while some firms who are in the plant trade as well report an increase over 1889 of from 15 to 25 per cent.

From Canada.

It was with deep sorrow that the Canadian florists learned of the death of Peter Henderson. No man in America was better known among the Canadian flower lovers than the deceased. Your loss is our loss, and you have our deepest sympathy. I have known Peter Henderson for nearly twenty years by having dealings with him, also through his works on horticulture. I did not know him personally until the recent convention of American Florists at Buffalo. I well remember the hearty laugh when I told him the story about the "Moon flower man." A gentleman who had forgotten his name called him the "Moon flower man of New York." I believe that Peter Henderson was as well known in Canada as in any state in the Union. Flower lovers know no flag, no nation, no language, but are one family bound together with a love for the beautiful in nature. Go slow. Perhaps the American friends think we Canadians are slow enough now. If Peter Henderson & Co.'s firm is an example of the terrible strain upon the members of business firms we had better remain slow. The price is too high. The game is not worth the shot.

A. GILCHRIST.

The First Gardening and the First Bouquet in Chicago.

Any one trying to learn somewhat about the early condition of gardening in any city in this country will find the data rather meager to go on. The first dug out, log hut, grain shipped, vessel to arrive, railroad, telegraph and the like is not difficult to hunt up, but who planted the first tree, laid out a good garden or who was noted for their liking to Adam's first calling is not so easily discovered after some lapse of time, and one has to depend upon the written memoranda at command.

But if the cases noted are not the first in their respective lines in Chicago we should be pleased to know of the earlier record.

Miss Harriett Martineau travelled through the United States in 1836, and in the progress of that trip made the journey from Niles, Mich., to this city. In her work "Society in America" of that time she says, "on my arrival in Chicago a fancy fair was going on, being too much fatigued myself to attend, the ladies sent me a bouquet of prairie flowers." Think of that ye florists of this city of 1890.

In the American state papers for 1818, military affairs, Vol. II, page 265, occurs the following, under the head of "Regula-

tions of the army:" "A more extended cultivation will be commenced at Chicago and other posts, of the cultivation of any public land not otherwise appropriated, in the vicinity of the garrisons and posts, shall be carried on by the troops, under the direction of the several commandants of the posts, and will embrace the bread and other such vegetable part of the rations."

The beginning was certainly quite modest, except that the one word vegetable might easily include a pretty large variety and yet come within the iron rules of military orders. EDGAR SANDERS.

THE "PLANET JR"

HORSE: 110E has a world-wide fame, and its hosts of friends are delighted with its improvements for 1890. First LEVER EXPANDERS Instantaneous in action, firm, strong, simple, accurate, perfect. HANDLE ADJUSTMENT Side and top levers, quick, stiff, grand for grapes, extra and in covering PARALLEL FRAME Standards interchangeable, STRONG, neat, CONVENIENT, admirable. We absolutely guarantee our 1890 Horse Hoe and continuations, and new patented features to please every practical farmer and gardener, and their money value to be far greater than ever. Look at it, and write us. *Continued free.* The "PLANET JR" has a "Fire Fly" plow, 40 in. wide, 10 ft. long, and a "Fire Fly" hand SEED DRILL, S. Double and Single Wheel Hoes, new and depth, difficult and easy seeds in small or large quantities, and under special care. In market gardening the Wheel Hoe saves their cost every few days. The "Fire Fly" Garden Plow is a delight in the family vegetable garden. The "Planet Jr." southern Seed Drill, which Hoe, Cultivator and Plow combines in an admirable way the qualities of all the rest, being delightful as a Seed Drill, Double Wheel Hoe while plants are small, Single Wheel Hoe, Cultivator—deeper or shallower, and Garden Plow. All the blades of these famous hand tools have long been made of hardened polished steel. Keep them bright and sharp, and you will save the full cost every few days. Send for full Descriptive Catalogue of all our goods. Write us your wants.

S. L. ALLEN & CO., Sole Mantles, 1197 Market St., Philadelphia, and true.

1890.

THE PUBLIC WANT

Would they not be most likely to obtain such by buying directly from the grower? I can buy seed at half what it costs me to raise it, but could not sleep sound should I warrant seed of this quality. Hence the reason I make special effort to procure seed stock directly from their originators. You will find in my new seed catalogue for \$20 (sent free from the usual price) an extensive collection (with the prices of some kinds lower than last season) and the really new vegetables of good promise. You should be able to get from me, Hubbard Squash, All Seasons and Deep Head Cabbages and many other valuable vegetables, which have been introduced by JAMES J. H. GREGORY, Marblehead, Mass.

SYNDICATE OF GROWERS

—) OF (—

FLOWERING BULBS, OLLIOULES, VAR, FRANCE.

We have the honor to inform the Seedsmen that from this year on the Syndicate will export its own products.

Heretofore, the bulbs have been sold to local merchants who have by common consent taken enormous profits, etc., in consequence of which advance in prices Foreign houses have decreased their orders.

As in future the growers can deal direct, Seedsmen will be able to purchase WHITE ROMAN HYACINTHS at exceedingly LOW PRICES.

Leaky Joints.

I wish to inquire as to the best method of effectually stopping leaks at joints of 4-inch hot water pipes. Of course I mean while the water remains in the pipes. Some of the joints were made of cement, and others of hemp packing and red lead. I would also like to know whether it is a common occurrence for two or three joints to leak in long runs of hot water pipes, caused by the expansion and contraction of the pipes, during very cold weather, when we have a very hot fire during the night and none much during the hot sunshiny days. Or if the joints are put together properly. Is there any necessity for their leaking at all? Perhaps some of your numerous subscribers, who have had experience, can inform me. W. H. HUMFELD.

offer an immense stock of all kinds of
FRUIT and ORNAMENTAL TREES, SHRUBS and VINES.
A 48-page descriptive illustrated catalogue free.

The Mild Season.

Messrs. Taggart & Wilbur, Norfolk, Va., send us a box of flowers cut from plants in the open ground, including roses, hyacinths and hardy shrub bloom. In a letter under date of Feb. 6 they say: "Fuchsias were in bloom till after Jan. 1. Last night at six o'clock it was 70° outside, and this morning at 8 it was 40°. In fact 28° is as low as we have had, and it has not been below 32° more than four or five times. Vegetation has had very little check, and roses have been making new growth all the winter. Last month we had an almond tree in full bloom, but with this cold snap I guess the almonds will disappear."

CYCAS REVOLUTA,

In all sizes from 8 inches to 3 ft. high, laid down in San Francisco, freight and all other charges paid.

Pot-grown, well established plants, with root balls (root balls excluded), per 100 lbs. U. S. currency, \$18.00.

Open ground, well rooted, out of my Yokohama nurseries, per 100 lbs., U. S. currency, \$15.00.

Freshly collected, prime quality, per 100 lbs., U. S. currency, \$12.00.

[Orders for less than 500 pounds cannot be executed, as orders for a few hundred pounds would cost too much freight in proportion.]

RHAPIS FLABELLIFORMIS.

Also laid down in San Francisco.

Fine cultivated pot plants, from 18 inches to 2½ feet high, per 100 shoots, U. S. currency, \$30.00.

The same, freshly collected, per 100 shoots, U. S. currency, \$10.00.

Cut Worms.

I read article in the FLORIST of February 1 about cut worms and think I can give a remedy. We have the simon pure article that cuts the plants off near the ground out of pure cussedness, as it seldom touches the top, and another rather lighter colored variety which I think is the one that is troubling Mr. H. Tong, as it seldom or never cuts the plant near the ground, but climbs up and eats the leaves. They did considerable damage for us in our smilax house before I knew what the trouble was, but finding a few one day when raking the bed concluded they were the cause, and that evening I took a lump and went into the house and found them very busy. I gathered 300 to 400, next evening got 30 or 40, and the third night only 4 or 5, and have not been troubled with them since. They can be seen very readily by lamp light; it is quite necessary to be careful as a slight jar will dislodge them when it would be very difficult to find them.

HUGHES

SOLUBLE FIR TREE OIL.

FLORISTS AND NURSERYMEN SHOULD
NOT BE WITHOUT IT.

Unsurpassed as an insecticide, it kills effectually all parasites and insects which infest plants whether at the roots or on the foliage, without injury to tender plants: such as ferns, etc. If used as directed. Used as a WASH it imparts the gloss and lustre to the foliage which is so desirable on exhibition specimens.

It kills insect life on man, animal, or plant, without injury to the skin, wherever parasites may appear.

Nyack, N. Y.

Mr. D. Lynch will build this spring one rose house 100x18 feet.

Mr. W. R. Davison will build two violet houses this spring 150x12 feet each.

Mr. H. G. Newton will remove his greenhouses from their present place to his farm in South Nyack.

Mr. P. Johnson, formerly with A. C. Tucker, is now foreman for H. E. Blauvelt. Mr. Blauvelt will build three rose houses 150x23 each this spring.

Mr. A. C. Tucker has had this season the finest Brides and C. Mermets ever seen; the plants were seven to eight feet in height, with abundance of foliage and loaded with buds.

Mr. M. Hogan, foreman for A. C. Tucker, was married on the 4th inst. We congratulate him. B.

"A Kicker."

"SIR!!"—I, just received 3 shriveld up cuttings of Girenumms aldo i had ordered Fejnchias. How any respectable house can descend so low; advertise what they do not got unsend some oder trash in place off it is more as what i can understand. i intentet to import a dollar wort of some new plants from you an yust sent you a schmall trial job which i did to find out how a hous does their business—I here with return your shriveld up cuttings and most earnestly comend you to return my quater dollar as i dont want them or any trash you would like to throw of your hands—if you should facd to return the money by return of the made i shal take the liberty to publish your transaction in our 3 local pabers and in the pacific rural press, hoping for the return of my money i am resp.

B. B.
Lendskape Gardner,
S. R. Cal."

THIRTY-TWO PAGES THIS ISSUE.

CHICAGO renews her invitation, made at Buffalo last August, to the World's Fair of 1892.

OUR NEW TRADE DIRECTORY is now ready. It gives a complete and accurate list of the florists, nurserymen and seedsmen of the U. S. and Canada. Price \$2.

Are Chrysanthemums an Injury.

BY THOMAS CARTLEDGE.

[Read before the Florists' Club of Philadelph'ia January.]

Are chrysanthemums an injury to the florists' business? I say most decidedly not, but a positive benefit. Either they or any other flower that a florist grows and can sell and make money on is certainly not an injury to us. Let me ask the question, What is a florists' business? Why to grow both plants and flowers and sell them either at wholesale or retail at a price that will pay him a good profit for his expenses, labor and outlay of cash, and leave a margin to be laid up for the traditional rainy day. That I take to be the florists' business we term a grower. I am sure chrysanthemums well grown will fill the above requirements. The florists who make a specialty of chrysanthemums, tulips, etc., might apply the same question to the rose grower, for certainly if no roses were grown he would likely have a better market for his specialties, but I do not think any one will assert that roses are an injury to our business, although they may be to the chrysanthemum florist or the orchid or bulb grower.

The other branch of the florist business, the retailer, the man who keeps the shop, buys wholesale of the grower both plants and flowers and sells them to his patrons at a small advance if he can not get a large one. I know by many years of experience that he makes as much money proportionately on his chrysanthemum plants and flowers as on anything else he handles. I do not intend to say that quite as many roses, carnations, etc. are sold as there would be if there was no such thing as a chrysanthemum on the market (but the chrysanthemum is here and here to stay, and under these circumstances what are you going to do about it?) but they do not hurt the sale of roses any more than tulips, lily of the valley, daffodils, or other flowers that are grown in quantity do. We must have variety, all our patrons do not love one kind of flower or plant; and again do not the beautiful ferns that we arrange in so many shapes for house decoration interfere greatly with the sale of all kinds of cut flowers and plants? Many of our customers prefer them to flowers; for many an occasion they crowd out cut flowers, not always because they are the prettiest, but because they are cheaper than roses or expensive cut flowers, and perhaps look a little more tony than the very cheap class of flowers.

Some will say chrysanthemums are a cheap flower and cheap flowers are no good, but I don't believe it. Now just let me knock that fallacious idea out of your heads by showing you the price chrysanthemums brought this fall. Ordinary ones with fair stem and foliage sold

at \$1 per hundred wholesale, carnations of good quality brought only as much, and the price this year was higher than usual. W. K. Harris, Mr. Craig and other first class growers of chrysanthemums that grow them so well that they are a credit to any florist or to the customer that gets them, got from \$2 to \$25 per hundred, and all sold readily at as high a price as the best roses on our market were bringing, and they certainly were fine and if they keep on improving they will make our darling roses hustle to keep their place on top.

Are they an injury to our branch of the business? is a question easily answered. What could we get to take their place All Saint's day when so many white flowers and plants are wanted for cemetery, house and especially church decoration? or what so beautiful in their snowy whiteness and quantity of flowers and for festive occasions? all the time they last they supersede everything else, benefitting us and our patrons not only by their beauty and effectiveness, but by their reasonable price, making more people use them, thereby extending our trade and making flowers seem to be a necessity, and the short time they are in their glory is another advantage to both grower and retailer. If they do hurt the roses it is for such a short time that our growers ought not to find fault. We know the rose growers are of the most consequence, but give the other fellow a little chance. In my experience there is always a boom in the flower trade when chrysanthemums come in, and why? may I ask; because they are so pleasing in color, so useful for decoration, whether for house, church or cemetery, wedding feast or funeral; the quantities exposed for sale in the streets and by the florists make people think of flowers, and thinking of them they buy them, and after they are done they buy roses and other flowers, thus positively benefitting the whole trade. I think we place a very low estimate on the intelligence and ability of our florists when we accuse them of growing plants and flowers that are an injury to their business. They certainly have intelligence and ability and are as wide awake as to profits as any other class of business men, and some of them seem to get their share of them and they deserve it too.

This question seems to worry our rose growers more than anybody else. Why don't they find fault with the ferns that come in competition with their roses all the year round? with tulips grown as largely as chrysanthemums, and all other flowers? Do they want the whole earth to grow roses on and crowd every other fellow off?

Lastly I come to the cheap flower. Don't we want a cheap flower? Are flowers to be only for the rich? Why should not our worthy working people have flowers for their jollities the same

as the rich? If they cannot afford to buy the beautiful roses and aristocratic orchids and palm plants, let them have their daisies, chrysanthemums and tulips. They certainly enjoy them as much as the rich; they don't cost as much as beer and tobacco and leave no bad headaches or unpleasantness behind. Let the poor working girl have her chrysanthemum plant or geranium, the sick girl her few cheap flowers by her couch, and the hospital patient also. They may do more good than physic and cheer the house of suffering and pain. Charity may begin at home, but it don't end there. Thank a kind Providence for the poor cheap chrysanthemum that is within the reach of all. I trust our florists will keep them there, growing them in quantity and good quality, even if we do call them cheap florists and cheap chrysanthemums.

Boston Notes.

The incoming of Lent has not made any appreciable impression on the cut flower trade, which still continues remarkably steady. This may be accounted for, in part, by the fact that the coldest weather of the season has prevailed since Lent came in, but it is undeniable that for the past few seasons the flower trade has seemed to feel less and less the effect of the fashionable stagnation which is expected to accompany the Lenten season, and it is to be hoped that this tendency will continue, for at no time of the year is the variety of cut flowers greater or their quality better than at this season. Orchids and ericas are just in their prime; cyclamens, primulas and violets, tulips, daffodils and other bulbous blooms, etc., are at their best, and choice roses of all kinds seem to throw their handsomest flowers just now when they escape both the weakening results caused by early forcing, and the debilitating effects of the warm spring days a few weeks later. In flowering plants the most effective thing at present is the genista. The florists' windows are gorgeous with the beautiful golden masses, and judging from the frequency with which they are seen in parlor windows these deserving plants are getting to be extremely popular. Some good amaryllises in bloom are also shown. A great many tulips and daffodils both double and single are sold for room decoration. They are planted in pans, averaging about a dozen bulbs to the pan.

At the weekly meeting of the Mass. Hort. Society on February 8 a very instructive paper on "Chrysanthemums" written by Mr. W. A. Manda, was read by Secretary Manning. On February 15 the subject was "Cemeteries and Parks," an interesting paper being read by Mr. J. G. Barker, Superintendent of Forest Hills Cemetery. On March 1 Prof. J. T. Rothrock, of West Chester, Pa., will read an essay on "Forestry." The annual spring exhibition will be held at Horticultural Hall on March 26, 27, 28. The schedule enumerates premiums amounting to about \$650, offered for tender azaleas, orchids, roses in variety, spring flowering bulbs and other seasonable things. On Saturday February 15 Jackson Dawson exhibited cut blooms of a pretty little semi-double pink rose, which was of interest from the fact that it was the result of a cross between the Japanese multiflora and the Gen'l. Jacqueminot.

All the stock in the greenhouses of the late F. C. Fisher at South Sudbury was sold at auction on February 12. It consisted principally of carnations, chrysanthemums and hydrangeas, all of which brought fair prices considering the circumstances.

W. J. S.

A TRIBUTE

Offered by the New York Florist Club to the Memory of

JOHN HENDERSON.

Another good man has gone. Another page in history has been filled with the record of a noble life, closing with the tribute we now place upon his tomb.

John Henderson's name is imperishably written in the history of American floriculture, and as indelibly engraved on the hearts of all who truly knew him. Cradled in the lap of wealth; endowed by nature with a love for the beautiful and good; having been educated at the fountain of English learning, visited in manhood's brightest years by the vicissitudes of fortune, he came among us poor but respected, and has departed from us rich and respected, bequeathing to his many friends gifts by example of honor, integrity, manly pride and virtue pure. His peculiarly fine moral qualities, his single-minded, straightforward manner and his genial kindness, together with his confidence in his fellow man, were adorned by rare intelligence and high moral culture.

In his intercourse with his fellow man he was never affectionate, rarely confiding, but always superior. He could not freely mingle with the masses, because he scorned petty ways and many of the social customs that strongly tend to destroy individual worth and to undermine character.

He loved quietness, pure thought, pleasant associations, the endearments of home, and abhorred every manner of vice and hypocrisy. When he professed friendship he meant friendship pure, free from dross and unalloyed with selfishness.

While his ambition in his business relations was only limited by his strength, he was most temperate in his desires, his strongest being duty to his family, simplicity of life, modesty and to be associated in every good work with severely candid, unselfish, honest men.

Modesty was one of the virtues that adorned his character. While his mind was richly stored with that which was beautiful, true and good, with knowledge practical, it could not reveal itself excepting to his small circle of choice friends. With strangers he had no communion. To the general public, or to a large assemblage, he could not convey his thoughts.

In every walk of life, whether in private or public business, in offices of trust or honor, it may be truly said of him as Emerson said of his friend Judge Hoar that "Wherever he sat down honor came and sat down beside him."

"His youth was innocent, his ripeness marked by some act of goodness every day. And, watched by eyes that loved him, calm and sage."

Faded his late declining years away. Cheerful he gave his being up, and went To share the holy rest that waits a life well spent.

"Why weep ye, then, for him, who having now The bound of man's appropriate years, at last Life's blessings all enjoyed, life's labors done, Sincerely to his final rest has passed. While the soft memory of his virtues yet Lingers like twilight hues when the bright sun is set."

Detroit Notes.

The flower trade here seems to have altered a good deal during the past two years; it seems to be running in the line of better stuff. Trade is still very unlike that of eastern cities; for example, hybrid roses are almost uncalled for; the only big rose desired is the Beauty, and that is not sold in any large quantity. The demand for orchids is very small.

There is no doubt that the flower show last year aroused a good deal of interest

in such subjects, and the coming show seems likely to be a still greater success.

But the average Detroit is not a very generous patron to the florist. Even the rich people skim the decorations in a way that would make a New Yorker faint. The florists tell sadly of some wealthy society women who will haggle about the price of a basket to put on the table when giving a dinner, and then kill two birds with one stone by presenting the basket to some absent friend after it has done duty on the table. But perhaps the most aggravating customer the florist has to do with is the person who buys a cheap bouquet of common flowers at the market in Cadillac Square, and then comes into a flower store and asks the florist to arrange these flowers in a box so as to look pretty. This style of customer does much to imperil the future salvation of a Detroit florist.

Of course there are some good customers and real flower lovers, but a large proportion of the population is neither. Trade has certainly increased, for there are now four times as many florists as ten years ago.

Purely natural arrangement of flowers, such as obtains in New York, comes in but slowly here; the people still go in largely for designs, and the florists naturally have to fill the demand. Decorations are rarely elaborate, while the prices paid for stuff are very low compared with those of the east. Many flowers are used which are comparatively out of date in the vicinity of New York.

Visiting here in the summer two years ago the writer was struck by the absence of window boxes or any great amount of bedding around the large residences. A certain amount of bedding seemed to be done around the summer residences at Grosse Pointe, but in the city there was little to be seen. However, the Detroiters begin to get a little more ambitions in this direction, and it is naturally to be expected that they will gradually go in for more generous decorations and more liberal use of flowers.

EMILY LOUISE TAPLIN.

A Wedding Decoration.

A recent wedding decoration arranged by Siebrecht & Wadley was unusually elaborate, the florists being given carte blanche. At the church a novel feature was a double row of great scarfothias all the way up the center aisle, forming an arch of foliage all along, while loose bunches of flowers were tied to the outer arm of each pew. The chancel was banked with palms, relieved by flowers; orchids hung here and there about the palms.

At the house the decorations were very elaborate, the most notable being a library which was used as the ball room. This was a room about 70 feet long; it was unfinished, being newly built, so the decorators were at liberty to do as much nailing as they liked. The walls and ceiling were completely covered with hemlock, showing nothing but the soft green. Suspended in the center of the ceiling was an immense wedding bell of flowers, while around it were arranged nine other smaller bells. At one end of the room was a bank of palms, while other palms were distributed about the room to break any stiffness and monotony of the walls. Orchids were suspended from the palms.

A number of great plaques were arranged on the green walls, varied in shape. They were made, for the most part, of ivy leaves arranged with flowers, which took away the monotony of plain

EPIPHYLLUM TRUNCATUM VAR. ROSEUM

green walls. An immense number of lilies were used.

In another room was the orthodox floral canopy for receiving, while the rooms were further decorated with plants and flowers. The staircase, a very large and handsome one, was similarly decorated.

This decoration took a tremendous lot of stuff; it was certainly the most elaborate arrangement of the season.

E. L. T.

A Beautiful Plant.

The illustration of *Epiphyllum truncatum* (Lobster cactus) shows a plant growing at the Bussey Institute. A plant of *Pereskia aculeata* was planted eight years ago under a side bench and trained to a rafter of the greenhouse. The following March pieces of the epiphyllum were grafted on the pereskia. After the first year the graft began to grow rapidly and now presents a most charming sight hanging from the center of the house.

It measures from top to bottom 47 inches, and from side to side 41 inches, forming an almost perfect ball. Since Christmas I should say there have been picked from the plant over 1,200 blooms and it is still thickly covered with flowers and buds, having at this time nearly 500 blooms.

The plant has had no especial care except occasional tying to keep it from falling. It has one enemy, the mealy bug, but by syringing the plant during the summer months the bug can be got rid of. This cactus is a native of Brazil.

The flowers are large, of a deep scarlet color, rising from the truncate tops of the branches.

Nice pot plants can be obtained by growing the pereskia a foot or so in height and then grafting them and the following winter nice drooping heads of fifteen to twenty blooms will be the result. The grafting is easily performed as it consists merely in opening the hardened stock either on the side or top and then putting in the scion which can be held in place by a thorn of the pereskia.

The above illustrated variety is roseum. Among the others noticeable are: bicolor, white, edged with rose; elegans, bright orange red; magnificum, flowers large, white, tips bright rose color; spectabile, white with purple margin, and violaceum, large, pure white with delicate purple margin.

CHAS. J. DAWSON.

Jamaica Plain, Mass.

Some English Notes.

BY SAMUEL HENSHAW.

[Read before the New York Florists' Club Feb. 10.]

There is nothing strikes the florist so much in revisiting Europe as the great difference in the amount of sunlight, and in fact "daylight," in the winter months as there is between the two countries; and as we all know everything is in favor of America; of course there is more coal required here to keep up the proper temperature for the production of winter flowers. But that is more than offset by the abundance of light, and the clear skies to be seen in the neighborhood of New York in winter; and there is no flower grown for winter decoration that shows the ef-

fect of this abundance of light as much as the rose. All through the middle of winter and up to April there is a great scarcity of this flower in England. Even the so-called tea roses are scarce and poor in quality, and it is useless to attempt forcing any of the hybrid perpetuals until late in spring. The variety that is the earliest to bloom with good buds is the Noisette rose, "Gloire de Dijon." This variety and a few of the tea roses were exhibited at the spring show at Bristol in March, but were few and very much inferior to what may be seen in any florist's window in the middle of the winter in New York City. In the south and south-west of England the Gloire de Dijon rose is often seen covering the front of cottages, and in full bloom early in May. Camellias are still grown there by the florists, and as this flower does not require as much sunlight to develop its buds as many others it is likely to continue useful with them. But there are many flowers produced in abundance in the neighborhood of New York in the middle of winter that are not seen in England until far into spring. Even the Marguerites will not open until the days begin to lengthen, and the winter flowering orchids with us are not seen there until nearer spring. Hyacinths and tulips are forced there in large quantities. The Maiden Hair fern is seen everywhere, and in making up flowers it is always used. The made up wreaths, hand bouquets, and corsage flowers are always garnished with Maiden Hair ferns. But in all the floral designs that I saw until June the scarcity of roses was very noticeable. As soon as spring has fairly set in there is great abundance of the typical "flowers that bloom in the spring." Of these the auricula is the choicest, and is grown by many of the cottagers with all the old time enthusiasm that we remember as boys. The primrose is a general favorite, and picnic parties are gotten up to take a jaunt a few miles from the cities when the children, and many of the older people, revel in the fields and country lanes, gathering the cowslips, primroses, and bluebells. These trips to gather spring flowers are looked forward to weeks in advance and form one of the very pleasing features of rural life in England. For by the time these flowers are in bloom most of the song birds are in full note and in full sympathy with the typical May Day.

In all the cottage gardens there is a wealth of wall flowers, stocks, polyanthus, the red and white double dwarf daisies, ariculas, pansies, the several varieties of the *Phlox subulata*, and saxifrages. These are replaced later on by the regular summer flowers. Musk is always found in an old garden, also moss roses, sweet brier, peonies, iris, hollyhocks, and lads' love, not forgetting the columbines and Turk's cap lilies. A favorite edging for the cottage flower gardens is the dwarf sea pink, and the London pride saxifraga. I was pleased to notice a gradual return to the old time herbaceous borders in some of the large places, making collections of the old and almost forgotten Grandmother's flowers. When summer has fairly set in hardy roses are abundant, and in great perfection. The flower shows are well patronized, and splendid plants of azaleas, orchids, cypripediums, ixoras, and the choicest of stove and greenhouse foliage plants are taken from Chettinham, Bath and to the London and Manchester exhibitions, and vice versa apparently without injury. I noticed at the Manchester flower show the various groups of plants exhibited were arranged on grass terraces laid out ex-

pressly for these exhibitions. This had a much more pleasing effect than the old time wooden benches; and at this show, which took place in the middle of June, there was a grand collection of specimen orchids in bloom. At both the Bath and Chettenham shows there were superb lots of orchids, and the collection of stove and greenhouse plants shown by Cypher & Sons, of Chettenham, were the finest I have ever seen exhibited.

Plant growing in or near the large cities in England is up-hill work, on account of the dense smoke from the many manufactories. But there are some plants that seem to be impervious to an impure atmosphere. Among these may be mentioned the chrysanthemum, pyrethrum, saxifragas, and among shrubs the rhododendron, dwarf elder, and the black poplar among trees. The hawthorne is everywhere and takes the same place in the landscape that dogwood does here, only the dogwood has no perfume. The laburnum and the mountain ash also grow well near the smoky towns. In the south and south-west of England the American live oak grows as well as it does in South Carolina, and the *Aruncaria imbricata* is apparently as much at home as in its native Norfolk Island. Other American plants do fairly well. I saw some *Magnolia grandiflora* fifty years old, and tulip trees older yet but not more than forty feet high. Some of the yuccas attain a patriarchal size and are never protected. I saw plants of the *Eucalyptus globulus* that had stood several years without protection in Somersetshire, and camelias in sheltered places in the shrubbery borders that had been there many years. Fuchsias are also hardy there, but the catalpa, altheas and many other plants common here will not live through the winter there. The *Sequoia gigantea* (or as they will persist in calling it there, the "Wellingtonia gigantea") grows well all through the south and west of England. Also both the Cedar of Lebanon and the Cedar of *Deodora* thrive well.

Hardy Herbaceous Plants.

BY WM. FALCONER.

A selection of hardy perennials depends upon circumstances—what you want them for, soil, situation and locality. Many florists will grow them chiefly for cut flowers, and others for stock for sale to amateurs, but all will want to get real good, showy, easily grown kinds that are ornamental in themselves, serviceable for cut flowers and hardy generally. These I will now deal with and leave for future papers special plants for special purposes.

During the summer months we have a large abundance of annuals as nigette, asters, sweet pens and zimias; tender plants set out of doors as geraniums and heliotropes, and an assortment of bulbous and tuberous plants as montebretias, gladioluses and dahlias, and all of which add so generously to our cut flower supply, that there is less demand upon summer-blooming perennials for cut flowers than there is in spring and early summer and again in fall, therefore it may be to our advantage to bear more heavily upon the early and late blooming sorts.

In the following list I have endeavored to cover the whole season from April till October, and the plants named in it are good, common, well-tried, well-worthy sorts, ornamental as garden plants and useful for cut flowers:

Daffodils,

Poet's Narcissus,

DICTAMNUS FRAXINELLA. (REPRODUCED FROM LONDON GARDEN.)

Tulips,
Trillium grandiflorum,
Arabis albidia,
Dicentra spectabilis,
Iberis sempervirens,
 Lily of the Valley,
 Paeonias,
Pyrethrum roseum, double,
Hemerocallis flava,
Fraxinella,
 Oriental Poppies,
 Clematises, early flowering,
Gaillardia grandiflora,
Lilium elegans in var.,
 Pinks, hardy, double white,
 German Frises,
Lychmis Chalcidonica, double scarlet,
Corceps lanceolata,
Clematis erecta, double,
Campnula persicifolia alba and double,
Rudbeckia speciosa,
Veronica longifolia subsessilis,
Delphinium, garden "hybrids,"
Phlox decussata, vars.,
Gypsophila paniculata,
Iris Kämpferi,
Yucca filamentosa,
 Hollyhocks,
Hemerocallis Thunbergii,
Achillea Ptarmica fl. pl.,
Helianthus multiflorus,
Platycodon grandiflorum white (true),
Euphorbia corollata,
Clematis Davidiana,
Lilium speciosum,
Phlox paniculata vars.,
Funkia grandiflora,
Chrysanthemum maximum,
Pyrethrum uliginosum,
Anemone Japonica, white,
Tritoma in var.,
Clematis "paniculata",
 E. Ind. Mountain Fleecce.

The common daffodils, single and double and the lovely bicolor, also the common doubles as Orange Phoenix and Sulphur Phoenix are hardy enough and long lived. The Poet's Narcissus is also one of the hardiest, easiest to grow and most multiplying; and we should also have the early-blooming form, ornatus. Besides the regular run of tulips have a lot of parrot and Gesneriana for late flowers.

Trillium grandiflorum grows wild in the greatest abundance in many parts of

the north and takes to cultivation very kindly, also may be forced year after year.

Arabis albidia in April is a sheet of snow white flowers. It spreads in mossy-like patches and seeds freely.

Dicentra Spectabilis or Bleeding Hearts is common in every old garden. Propagate by division or from cuttings which may be obtained in quantity if the old flowers are cut off as soon as faded.

Iberis sempervirens is the commonest and best of the evergreen candytufts, for it is the hardiest. Flowers white, in the greatest abundance, very early and lasts for several weeks.

Lily of the valley, to grow it well, give it a moderately open position, good ground and an annual dressing of rotted manure. Don't grow it in the shade if you want flowers.

Paeonias; first come *tenuifolia* and the old double scarlet and the tree paeonias, and these are succeeded in June by the gorgeous herbaceous sorts of which now we have a rich assortment. All are hardy and sure bloomers.

The double pyrethrums, white, pink and crimson, are excellent for cutting, and the plants multiply freely. There is quite a demand now for the single forms.

Hemerocallis flava is the early clear yellow day lily, but *Dumortieri*, orange-yellow, opens ahead of it. Later on we have *graminifolius* and *Thunbergii*, both yellow. The tawny colored ones are hardly to be considered for cut flowers. All hardy, free growing and sure blooming. Easily multiplied by division or from seed.

The white *fraxinella* is a handsome garden plant, so too is the purple; they live "forever" in thin shade or open, and bloom profusely, but their disagreeable odor and sticky flowers excuse them from the flower basket except for immediate home use.

The whole poppy family are a gorgeous race and none more so than the Oriental. If cut the morning they first open the blossoms will last well for a couple of days. And this is peculiar of most poppies.

A very persistent perennial and spreading underground.

Clematises. Florists should grow a

GAILLARDIA MAXIMA

CHRYSANTHEMUM MAXIMUM

good many of the garden "hybrids," early, middle season and late; if cut when they first open their flowers they can be made great use of. Among the non-climbing sorts erecta is the best, but be sure you get the double flowering variety of it, as this is the whitest. Davidiana, blue, very fragrant, has recently come into prominent notice, it is hardy, copious, late and well worth growing. "Paniculata" isn't the name of the kind that is sold under this name, but no matter, this clematis—one of the fleecy white ones, is indispensable for September flowers, so get the plant and never mind the name.

Liliums are peculiar in their behavior. The many forms of elegans come in early, so too do tenuifolium, and as the season advances we have candidum, longiflorum, superbum, auratum, double tiger, and last of all the beautiful speciosum. You have got to try the different kinds and hold on to the ones that thrive best with you. Strange though it may seem, Haussoni, one of the most expensive of lilies, thrives and multiplies like a weed with me, candidum dies out with disease and Japonicum refuses to be comforted.

The common double white hardy pink comes in abundantly in June, and I make

edgings to the borders with the plants and lift, tear apart and replant them in spring, but they blossom all the same. The "hardy" Scotch pinks in frequent use often behave better when wintered in frames than when left out doors.

The perennial gaillardias are forms of *G. aristata*, but nowadays we have gotten grandiflora, maxima, and a host of others differing from each other in the size and marking of their flowers. They come in in June, and last more or less in bloom till November. Easily raised from seed and perfectly hardy.

The iris race is a big one and great is the confusion that reigns among them. Beginning in March or April with reticulata we pass on in May to pumila, then cristata, and into the great German group and weedy Siberians till we wind up the season, early in July, among the gorgeous Japanese *Kaempferi* varieties. Although all can be raised from seed, the only way of increasing the finer forms true to kind is by division, but from seed, especially among *Kaempferi*'s, we get lovely flowers.

The double flowering scarlet *Lychnis Chalcedonica* is one of the handsomest of hardy flowers, and the blooms last for weeks. But it is slow to increase.

Corcopsis lanceolata is the prettiest and most useful of its race and easily raised from seed.

Among campanulas, *persicifolia alba* is desirable, and especially so is its double form. All are easily increased by division, and the single also by seed. The platycodon is also a bell flower. Be sure you get the pure white variety and not the bluish white one.

Rudbeckia speciosa often catalogued as *R. Newmanii*, is, I think, the handsomest black-eyed-Susan grown; the flowers are showy and the plant compact. Easily gotten up from seed, and the plants live for years.

Of all the tall speedwells I look upon *Veronica longifolia subsessilis* as the best. It is a capital garden plant, but I fail to find any enthusiasm for this style of blossom as cut flowers.

In the way of delphinium or perennial larkspur we have recently made great strides, and the Rochester and Passaic hybrids are equal to any of Lemoine's that have come among us. Hardy, showy and gotten up in any quantity from seed. Grow also a few of grandiflorum, the habit and the color are good.

In early spring we have running phloxes as *amanea* and *reptans*, then we pass into summer with the *decussata* section, which are very useful for cutting, and move on into late summer with the army of panicle phloxes, so pure, so bright and so variously colored. Easily raised from seed, but only perpetuated in variety from division and cuttings of the young sprouts.

Gypsophila paniculata is very useful where airy, sprayy flowers are needed. It will live in poor sandy land if need be, for it makes deep-reaching tough fleshy roots that live forever. Increased from seed. The *Euphorbia corollata* comes in after it. This too strikes its roots down deep into the earth, and is better increased by root cuttings than in any other way.

Yucca filamentosa should be grown for its generous blossoms and its ornamental character generally. The plants are easily raised from seed, but the seedlings have got to be several years old before they blossom. Once planted it seldom dies out.

All florists who grow miscellaneous flowers grow hollyhocks, and by a system of fall and winter sowings and cutting back manage to have hollyhocks continuously from July till frost.

Achillea Ptarmica fl. pl. is grown in large quantity by many florists because it keeps in bloom most all summer, and its little white flowers are so useful for "making up." Increased by division and cuttings.

The white day lily (*Funkia grandiflora*) is indispensable, and welcome indeed coming in in August and September. It loves good ground and a shady place. Division.

Helianthus multiflorus or rather the large-flowered form of it and the double variety come in real handy in summer and last a long time. By cutting them down in June they bloom some weeks later than they would if not cut over. But it isn't reliably hardy. If you take up a clump or two in fall and winter them over in a frame, cellar, or cool greenhouse you can propagate from them any amount of plants in spring, and all will bloom in summer.

Pyrethrum uliginosum furnishes myriads of white daisies in September. It loves good ground, plenty room, timely support and to be lifted, divided and replanted every second or third year. Propagated by seed or division. *Chrysanthemum maximum* is also a fine large

white daisy useful for cutting, but grows only about two feet high. Increase in the same way.

The tritomas or torch lilies should find a place; from midsummer till December they yield their showy spikes. The forms known as *grandiflora* and *nobilis* are the best among common sorts, and corallina the freest blooming of all. But they are not reliably hardy, and require either heavy mulching outside or to be lifted and wintered in the shed or cellar. By seed and division.

Florists living in mild localities should grow some of the mountain fleece (*Polygonum amplexicaule oxyphyllum*) for its fragrant fleecy blossoms which appear in October in such plenty. While the roots are hardy early frosts destroy the blossoms.

Cost of Production.

The cost of labor and material used in the manufacture of any given article with the expense of putting it on the market and converting it into cash, constitutes the bulk of its net cost to the manufacturer. It is therefore obvious that a person devoting his time and capital to the construction or manufacture of such given article, should, in a measure, possess the prime factors of knowledge necessary to the successful prosecution of his particular industry. Now the florist is no exception to the rule, he is just as much a manufacturer as is the man who devotes his time and money to the fabrication of any other article of use or ornament, and it is just as important that he should work with his eyes open as if he was engaged in any other industry. It is a very important matter for the florist to know after a year's struggle with difficulties whether he has lost or made money by his year's effort, and if he has made money it is just as important that he should know in what way he has made it, and off what particular branch of his business; he can then devote himself to the paying part, and let the unprofitable parts of his business alone.

I have been asked to furnish the readers of the *FLORIST* with a paper showing the approximate cost of the production of carnation flowers. Of course I can only do this so far as my own observations and business are concerned, and in order to present the matter in as simple a form as possible I will use one house for the purpose, in which carnations have been grown for the last four years.

The house is 120 feet long and 18 feet wide and contains about 2,240 plants, all colored varieties; the number of flowers at every gathering are put down on a slate which hangs conveniently for that purpose, and at the end of each month the total for the month is entered in a book provided especially for that object. During the year 1889 the total number of carnations gathered from this house, all with long stems, was 74,849, the greater part of which were sold in my own store at retail, at different prices according to the time of the year, but for the sake of convenience I put the uniform price of two cents each or \$2 per hundred which amounts to the sum of \$1,496.98.

The house in question is one of a set of

six which I had built four years ago and are alike in every particular, and cost with heating apparatus, ventilating gear, double thick glass, three coats of paint, etc., about \$14 per running foot for each house, which for the one in question would amount to \$1,680, the interest of which at 6 per cent per year would be \$100.80.

The estimated present value of the land which these houses occupy is 60 cents per square foot or \$1,500 per city lot of 2,500 square feet, which for the 2,160 feet occupied by the one house would amount to \$1,296, the yearly interest of which at 6 per cent would be \$77.76.

In these houses I regularly employ three men, and one man at same rate of pay Sundays, one sixth of the whole time chargeable to this house would be 182½ days, which at \$1.50 per day amounts to \$273.75.

Fourteen tons of best coal at \$5 per ton is \$70; three days extra labor moving old and putting in new beds \$7.50; city water at \$130 per year; this water also supplies my dwelling house, outside frames, etc., so I charge the house with one tenth, \$13; preparation of soil and manure \$20; wear and tear of hose \$5; tobacco stems and other odds and ends, \$5; yearly cost of paint outside and most exposed parts inside, all done with same men during summer, 100 pounds best white lead and three gallons best linseed oil, \$8; annual share of telephone service, \$18; general wear and tear of the house per year, \$50; which is all the expenses of which I have any record, and which amount in the aggregate to \$648.81. And which being deducted from the sum realized for the flowers leaves a net profit of \$848.17, making the actual cost of the flowers a little less than \$9 per thousand.

By way of recapitulation I would mention that the annual coat of paint reduces the wear of the house to a minimum, especially as the very best material is used, the inside of gutters and lower ends of sash bars being painted same as outside, I have no doubt makes the yearly loss in that respect less than I have put it. I may also add that the carnation cuttings taken from this house, although rooted and prepared in other houses, would add at least 15 per cent to the net profit, as no additional labor, fuel or other expense was incurred.

The varieties grown at first end of the year were Grace Wilder, May Queen, Portia, Anna Webb, Buttercup and two or three other sorts in small numbers, with Tidal Wave added at last fall's planting. H. E. CHITTY.

Paterson, N. J., Feb. 10, '90

The Carnation Belt.

Mr. Chitty strikes the key note when he says that the cause of carnations being a success in Chester county is that the growers take a pride in and devote themselves almost exclusively to carnations.

Any one with almost any soil can find some carnations that he can grow profitably, by trying various sorts and carefully noting those that do best with him. Mr. Chitty no doubt noted the absence of *Hzne's* in the section named. One of the growers there tells me that his *Hzne's* did not grow any outside and did not bloom until spring. Almost any grower will find that there are some varieties that do better than others on his soil and some that are a success with others he can not get satisfactory results from himself.

I have also found that some do better on solid beds, some on benches. This is notably illustrated by the fact that a few

dozen *Lamborn* on a solid bed did very poorly while those on a bench were exceptionally fine. *Hzne's* were just the reverse, those on solid beds are much better than a few planted on benches.

Among the newer ones the best with me are *L. L. Lamborn* (white), *Pride of Kennet* (crimson), *Tidal Wave* (pink). *Grace Wilder* has found its rival in *Christmas*, and when Mr. Starr introduces his *Golden Gate* we will have a yellow that for color and finely formed flowers can not be excelled.

Lancaster, Pa. A. M. HERR.

Propagating From Forced Plants.

Mr. E. S. Bartholomew, Westfield, N. Y., whose greenhouses were destroyed by fire February 13, writes:

I had two years ago instituted a series of experiments to determine how much the continued propagation for stock, from forced plants, had to do with the decline of the vital forces of our plants used for cut flowers; and whether to that cause alone the many diseases to which the carnation is liable, was not directly traceable. So far as had been done it very distinctly pointed in that direction, but all my stock under process is now gone without determining full results.

The Increase of Bulbs.

The capacity of a seed, plant or bulb to multiply, if given a few years time, would appear almost incredible to those who had never given the subject much study.

It is not uncommon to hear of a farmer who has given a child a lamb the increase from which the child is to have when he is 21. Why not encourage a child to grow a choice bulb until he is 21? One of the very best standard varieties should be selected, a variety that will always sell and if properly cared for, the increase of which would afford him the means for an education.

I can remember when I would hardly look at a gladiolus. But one day I saw some good ones, and from that time I have been growing only the best, with both pleasure and profit. Those who think they do not like them can not have seen the improved varieties. A few spikes make a lovely bouquet and they are very easy to grow; if you have no market grow only those varieties that will create a market.

I thought I would take one gladiolus bulb and ascertain what the increase would be in five years. I selected *Mme. Monneret*, because at that time it was the prettiest one I had seen, and I find it still a good variety. It blooms late, fine spike, a pleasing shade of pink that makes it valuable as a cut flower. In the spring of '86 I planted one small bulb; in the fall of the same year I had one large bulb and over forty bulblets to plant out in the spring of '87. In the fall of '87 I had forty small but blooming bulbs, and by actual count 500 bulblets. In the fall of '88 I had 500 small but blooming bulbs, and by actual count 4,500 bulblets. In the fall of '89 I have 500 three year bulbs, 4,500 two year bulbs, and the bulblets I had not the patience to count, but thought 50,000 would be a low estimate. Next year would be five years and I easily could have 50,000 bulbs if it was not for selling them as soon as they become marketable. I think that 50,000 from one bulb in five years ought to encourage the most indolent, showing what a rich mine lay in one small bulb.

It is generally believed that as good bulbs can not be grown in America as in Holland. Select the soil, climate and

SALVIA SPLENDENS VAR. BRUANTI. COLOR OF FLOWERS BRIGHT SCARLET.

take the same unceasing care and who could tell the difference between a lily, tulip or hyacinth grown in America or Holland. They are oftentimes obliged to dig their bulbs before fully ripe, and that with the journey will offset some of our disadvantages. The time was when everything to be good and salable had to be imported, but owing to our American enterprise that time is gliding swiftly by.

I have a fine double pink hyacinth that I have grown for twenty years. It is perfectly healthy and gives a good spike with ordinary care. Bulbs are individuals and can not run out, although by abuse they can be run down. If not too long neglected they can be restored to their

former beauty if given a fair chance. I dislike to hear any one say a plant has "run out" when it is suffering from abuse.

MRS. EVELYN ARNOLD.

Grand Rapids, Mich.

Lilium Harrisii at the Holidays.

On page 262 Reader asks how to have Lilium Harrisii in bloom at Christmas and New Years.

When the lily was first advertised I bought a few, also a few longiflorum. Potted in November in 7-inch pots, soil rich and made light with sand, fine charcoal and coal ashes; grew all winter near

glass in a light warm house. Flowered Harrisii; no flowers from longiflorum.

Bulbs were ripe in early spring; placed pots in cool shady place outside on their sides. In July shook out bulbs which were very large, cleaned off dead roots, carefully saving live ones; repotted as before, putting one inch of broken oyster shells in bottom; the tips of bulbs just showed at top; placed in cool, partially shaded place; as they sprouted moved them into a sunny, well sheltered place. Early part of September placed in a house sloping south and when plants were nine inches high repotted into 10-inch pots, some of the strongest into 12-inch, potting plants two inches lower in pot.

In a copper kettle I put two quarts steam-rendered bone, $\frac{1}{2}$ pint each muriate of potash, nitrate of soda, sulphate of ammonia, guano, one quart tobacco ashes and filled kettle with drainings of heap of dressing, mostly cow. To three gallons of warm water $\frac{1}{2}$ pint of liquid was added, and this was the water with which the lilies were watered every time, but they were not watered until necessary.

First flowers of Harrisii November 10, of longiflorum December 3, and every flower of all cut before January 1. Before flowers were open some plants began to show strong shoots from the bulbs, and a second crop of flowers, full as large as first, was cut before or at Easter, from longiflorum as well as Harrisii. Although the longiflorum were nearly a month behind others the shorter petal and greater substance made packing easier. I also succeeded with Bermuda bulbs first season by potting as early as obtainable.

For the three years that I have forced these lilies I sent them to Doyle, Boston, entirely I believe without competition before Christmas. FRANK BUFFINTON.

Fall River, Mass.

Salvia Splendens var. Bruanti.

For flowering during the autumn and winter, there are no plants more showy and valuable than salvias, of which there are a great many varieties, embracing a wide range of color, some being of a very bright scarlet; these are remarkably telling, the first among them being *S. splendens* Bruanti, which, besides its tall spikes of brilliant bloom, has beautiful foliage, the contour of the plant is pleasing and striking; and it is only about half the height of *S. splendens*. To have this salvia in really good condition, it requires more heat than an ordinary greenhouse affords, the most suitable temperature being 50° to 55°, in which it will continue to branch out and flower with freedom.—*Gardeners' Chronicle*.

Freesias.

Mr. Falconer's notes on *Freesia refracta* bring to mind the way it varies with me. I have one strain that always gives me, under whatever condition grown, small flowers and seldom more than six or seven on a spray; this came originally from a firm in New York city. Then I have another strain obtained from another firm, the flowers of which are nearly double the size of the first named and never less than eight flowers on a spray. What can make the difference?

Chatham, N. Y. R. E. SUFFELT.

SLUGS.—I can sympathize with Mr. L. P. Cutler. The same slug has been troubling me, and not only among violets, for they eat the pansy buds so as to render the flowers worthless. I hope some one will be able to give a remedy.

R. E. S.

Hints for Beginners.

BY WM. ROBINSON, NORTH EASTON, MASS.

I would advise growing cattleyas in baskets and they should be kept well up to the light and have plenty fresh air. When in active growth, that is when developing their pseudo-bulbs, they should get plenty water, in fact, they should not be allowed to get dry. They do not require much potting material, but what is used should be put in firm around the plants. A night temperature of 60° in winter with a rise in the day time to 68° or 70° is about right; and I always prefer having a little ventilation, however slight, from below, and very little on the top, it keeps the atmospheric moisture in the house. In the summer time the night temperature should be as low as practicable, say 65°, with a good rise in the day-time, say to 80°, with plenty of ventilation and moisture, and shade from hot sunshine, otherwise the plants will get yellow-looking and then they are not so pleasant to the eye.

Odontoglossums, in summer, should be kept as cool as possible, given abundance of fresh air and never allowed to get dry, in fact, it is well to hose them overhead every day. Repot as small as possible, in September, and allow the temperature at night to fall to 45° and in the day-time rise to 60° and keep shaded for at that season they begin rooting and growing.

Cypripediums should never at any time be allowed to get dry, they are moisture-loving plants, and delight every day in plenty of water, but of course care must be taken that the plants are properly drained. Should you ever detect damp-spot on your plants be assured you are growing them in too close and shady quarters, so give the plants more sunlight and that will stop the spot.

Dendrobiums should be grown near the light and only partially shaded. While growing, all basket plants require plenty of water until they have finished their growth then they must be gradually ripened, and afterwards, if removed to a cool house they can be kept back as long as desired.

Cecylonyes should be grown in a good exposed house, near the glass and kept cool. They delight in plenty of air, and when growing in abundance of water. If grown slow they are sure to flower.

Laelia anceps should be grown in a sunny south-facing house and have an abundance of air. Allow it to grow on slow, and while growing it should never be dry.

Cypripediums at Mr. DeWitt S. Smith's, Lee, Mass.

On a recent visit to this handsome collection of plants, the first thing that attracted my attention, was a fine lot of well grown *C. Spicerianum* in full bloom; they were in 7 and 8-inch pots, each one bearing from sixteen to twenty blooms, many of the scapes being twin flowered. I also observed a grand specimen of *C. callurum*, which had produced six strong flower spikes well laden with flowers; by its side was a plant showing flower, of the scarce *C. Schomburgkianum*, also

C. Arthurianum, a very rare hybrid between the beautiful *C. Fairieanum* and *C. insignis*, a fine variety handsomely marked and very showy. *C. lucorhodium* was exceedingly fine having produced three flower spikes, and the chaste *C. acanthum* and its variety *superbum* was well represented, several plants being well bloomed.

It would occupy too much space to name in detail all the fine orchids seen in bloom but mention might here be made of some fine *Laelia anceps* varieties, and cattleyas which were well furnished with flower spikes. Some fine *Saccolabium giganteum* were also well bloomed and crowded with spikes. Several of the scarlet flowered *Sophrontes grandiflora* were seen in perfection, for the whole of which great credit is due to Mr. E. Norman the gardener, for the successful way in which he has brought this collection to its present fine condition.

PETER MACDONALD.

Summit, N. J., Dec. 11, '89.

Odontoglossum Pescatorei.

(Ornate-tipped Variety)

Several handsome varieties of *Odontoglossum Pescatorei*, with spotted sepals and petals, which have appeared among importations, render us familiar with forms of that kind, and reference to our illustration of *O. P. leucoxanthum* from Baron Schröder's collection, demonstrates that there is at least one plant of *O. Pescatorei* which has flowers wholly white, except for the tinge of yellow in the center.

For another extraordinary variation in which the purple spotting, more commonly to be seen on the petals, is also displayed on the labellum, we are indebted to Sir Trevor Lawrence, Bart., M. P., the president of the Royal Horticultural Society. It is noteworthy, too, that with the spotted forms, as with the pure white variety alluded to, the flowers display a marked advance on those of the type in size and substance, thus making them doubly welcome in gardens.—*Gardeners' Chronicle*.

Steam Heat for Orchid Houses.

BY WM. ROBINSON, NORTH EASTON, MASS.

For a large establishment I would rather have steam than hot water. And I prefer it particularly as we have it here, governed by electric pneumatics having a thermostat in each house with a switch having a radius of 15 degrees. Each valve in our supply pipes is governed by a diaphragm which is connected with a pneumatic supplied with a small air pump. This is connected with an electric pneumatic which is connected with the thermostat.

Assuming we do not wish the temperature of the house to rise above 75° we set the switch at that point, and if the temperature rises to that point the thermostat expands and touches the electric strip which opens the electric pneumatic and the pressure of air closes the diaphragm. The temperature falls two degrees and the strip contracts, touches the opposite point, closes the air supply, opens the pneumatic tube and the pressure of steam opens the valve. At night time we turn down the switch to the point we require, if to 60° we turn the whole radius.

For the cattleya house we have the radius from 70° to 55°, the East India house 75° to 62°, *odontoglossum* house 60° to 45°, *phalaenopsis* house 80° to 65°, *masdevallia* house 55° to 45°, and the *Odontoglossum vexillarium* house 60° to

50°. If we should want any point between these figures we only turn a third and it allows 5 degrees. We can alter the points any time and set them at any point we like, so you will see the advantage of steam with this arrangement over hot water.

Assuming it has been an extremely cold night and one has got the hot water pipes extremely hot, and it comes a hot sunny day, what happy conditions for thrips, red spider, etc. Again, should the day turn out extremely cold, it would possibly take one all he could do to moon to get the temperature of his East India house up to where it should have been at 8 o'clock in the morning. By steam we can get up the temperature to what we please and when we please, and we can use water abundantly to moisten the atmosphere, uncongenial quarters for dry air loving insects.

Tuberous Begonias.

Having many inquiries about tuberous begonias, their propagation, culture and adaptability for various purposes, I will give through the *FLORIST* our methods of treating them.

The most rapid way of increase is by seed. The seed is about as fine as dust, and while it is not a difficult task, as the seed germinates readily, still it will be found a delicate operation and one that requires constant attention for a couple of months from the time of sowing seed. We sow in flats 2½ inches deep, being preferable to pans or pots as we can control the moisture better; ours are made of ½ inch stuff 12x18 inches, use lath for bottoms, fill about two thirds full of fairly coarse leaf mould and sand or any material that will not become sodden, about an inch of leaf mould and sand finely sifted placed on top, now soak thoroughly, be sure to have level surface, as soon as water has fairly soaked through sow seed, sift over it with fine flour sieves a slight covering of leaf mould.

There should be something over this until the seed comes up, we have tried glass laid on top of box, but this requires attention in removing moisture that accumulates on under side of glass and it is difficult to moisten the soil if it becomes dry. Another covering, and a good one, is common, coarse brown paper, place this directly on the soil, if necessary the soil can be moistened by watering the paper; being porous the water passes through. But the best material we have found is sphagnum moss, the longer the fibre the better; cover the soil completely with a thin covering, this will preserve about the right moisture, still if it should become dry you can water freely, as the moss will prevent any washing.

Of course watch must be kept under the paper or moss and as soon as the tiny plants appear remove this covering. Now place a glass over the box for a few days until all the plants are well above the soil. Admit air and harden gradually, as soon as possible after second leaves appear prick out in flats or pot off in thumbs.

After removing paper or moss we do not water with the rose, but place the flats in water so it comes level with soil and it soaks up throughout from the bottom. If watered with the rose more or less of the little plants are apt to be washed out.

Once the plants have taken hold after transplanting it is surprising how fast they grow, in one month one could hardly believe so small a beginning would produce such a plant. The way we transplant the seedlings, we loosen them from the soil and lift them with a wet pointed stick, or a stick with a notch in the end,

OONTOGLOSSUM PESCATOREI VAR.

they are so small that they can not be picked up with the fingers; for first potting we use quite porous soil, say leaf mould, loam and sand.

The finer named varieties of course can only be increased by cuttings, which I am sorry to say are only sparingly produced by some varieties, in fact by most of them. The tubers do not take kindly to having successive batches of sprouts removed like the dahlia, but they all produce more or less.

The best cuttings are the sprouts and side branches when about two inches long, the poorest being tops. They can be rooted in cutting bench or flats or singly in small pots, the latter we use with the finer varieties. All that are started before July 1 we pot on, the earlier ones are shifted on to 5 or 6-inch pots and make as fine plants as we grow.

All that are started after about July 1 are left in the flats or pots until started the next spring. Propagating is continued through September; if the cutting fairly callouses and throws out a few roots the tops will dry off and the embryo tuber will start in spring and make as good a plant as a tuber two inches in diameter. I prefer a small tuber to grow a specimen plant from.

The tubers should be started in March and April and not until they show signs of growth, which is the starting of the pink buds on crown of tuber. Do not try to force them, let them take their own time and I assure you they will grow fast

enough to satisfy any reasonable expectation. Use any good porous soil, not too light. We use leaf mould and loam; if the loam is not sandy add some sand. We are not over particular as to soil, using any good soil we have on hand.

Our leaf mould is the mould gathered in the woods and laid a year or so in pile, turned two or three times. Shift on as fast as roots fairly fill the soil until they begin to bloom.

If grown in house they require plenty of fresh air and shade from direct rays of the sun. For planting out from pots or flats it can be done as soon as danger of frost is past or the dry tubers can be planted the same time as gladioli.

Those that are grown in pots, as soon as done flowering in November, can be dried off, and as soon as the stem parts from the tuber can be stored away in pots or shaken out and put in boxes. Those in the open as soon as tops are touched with frost can be taken up, placed in dry shed free from frost, the stems will fall away from the tubers in a few days, when they can be placed in boxes.

How and where shall we winter them? In the pots in which they grew (which should always be done with late struck cuttings), in boxes or in heaps, anywhere that they will not be frozen or baked. The best place is a cool cellar, one that will winter potatoes will keep begonias all right. We have had them under the benches in the greenhouse where they were perfectly dry and where the drip ran on

them, in both positions they came out all right. I will guarantee them to keep all right if put in boxes and covered with soil or sand stored in any place where a potato will keep. They will keep as long and as sound as the potatoes. I never handled any tuber or bulb that can be wintered with so little care, and this one fact will add much to their popularity.

The singles only should be used for bedding unless it should be some double like Louis Bouchet. We planted out quite a lot the past season, they all grew vigorously, flowered freely and were not affected by the sun. I am sure they will be a success as a bedding plant as soon as a stock of suitable varieties can be worked up or a strain of seed produced that will give plants of uniform height and color. They should be medium sized flowers of the erect section, or those, to use the English of a certain foreign grower, "that present themselves right straight forward to the beholder."

In the doubles we have a great variety of form. Some resemble camellias, others are like a hollyhock in form, not substance. The beautiful rose form, peony form, another class have a form of their own, I should call them the nosegay form. The flowers of this class are of the largest size, each bloom is made up of a number of small individual flowers, each having a foot stalk of its own. As the flower obtains age they become more distinct until they resemble small bouquets of pompon flowers. Among the varieties raised by Van Houtte are many of this class of which the Prince of Battenburg is a fine example. I have had flowers of this class remain in perfection for three weeks, in fact, all the double begonia flowers are very persistent.

Still another class, fuchsia form. The resemblance is carried out in the plant as well as in the flower. The tuber throws up a main stem about two feet high regularly branched, with small pointed leaves covered with bright scarlet drooping flowers. This variety I believe will make a fine bedding plant and can be rapidly increased by cuttings. A temperature of about 65° is what seems to suit them best, always see they have plenty of fresh air. We start our seeds in same temperature, only give bottom heat, the latter is not essential.

A more brilliant mass of color can not be imagined than a house full of tuberous begonias in full flower. The varied coloring, scarlet, yellow, white and all the combinations and mixtures of these colors with an amount of bloom that is almost incredible makes a show that for brilliancy and richness will long be remembered, and this display can be kept up for five or six months.

F. J. MEECH.
Charlevoix, Mich.

The Night Man.

Considerable has been said lately concerning the night man, and in order to keep the ball rolling I would like to put in my little orr. I agree with Mr. Falconer in that the man doing night duty can do considerable work besides tending the fire. But Mr. F. can not have a steam plant, because a steam boiler could not be left long enough to drive three miles to a railway station to fetch him home. In a recent issue Messrs. Gooding & Leitch, of Cleveland, seconded the matter, but in a different style altogether. Now it is not so much in what they say as in what they don't say that the flea bites. We must infer that they employ a night man, and also that he don't give satisfaction.

Now I am doing night duty and the least I can say is, I have a pretty hard

man to work for. Just let me cite an instance. Until a month ago so sure as I would arrive at the greenhouse at 6 p. m. the temperature of each house would be way down, the flues (I have a steam plant) of the boiler full of soot, the water in the boiler down below one gauge, grate bars full of clinkers and the ash pit full. In less than thirty minutes after I got to work my boss would go in the houses and expect to find the temperature exactly as he wanted it. Now it is impossible to clean the flues, the fire, fill the boiler and get a fair temperature in the houses in less than an hour. Invariably I got a raking over and as my boss is a foul mouthed man, I got the full benefit of all the sheol language he could think of; sometimes the air got so sulphury it was unnecessary to burn sulphur for months at a time, and the glass got as blue as a clear sky. But things have changed lately, we have a new day man who makes it his business to look after the fire and temperature by the time I arrive and so now every thing is lovely and the goose hangs high.

Now a word to Messrs. Gooding & Leitch and others who employ a night man. Don't expect him to do impossibilities, use judgment and discretion; if you find a house a few degrees higher or lower than you want it, don't curse and swear at the man, tell him gently; he has feelings as well as you. If he asks for a job don't tell him you can't trust him to do anything without you at his elbow; then again, don't set him washing pots, that is a poor job for night time. I hate it and so does every other night man that is not a Chinese. Let him make boxes, do a little potting, put in cuttings, etc.; there is lots of other work a man can do.

Are you in the habit of going on a little spree? My boss is. If so don't give the man a half hour lecture on economy, because he burns two lanterns occasionally; lanterns give poor light at best. Don't promise your man a certain wage and then cut him down 50 cents or \$1 or \$2 a week, and tell him if he ain't satisfied that there's lots of other men idle. Above all, don't talk about the man behind his back; he hears all you say about him. If the night man at G. & L.'s is giving satisfaction and does the best he can their words in the *FLORIST* were a lasting and stinging insult to him. Let them examine themselves, maybe their men have something to contend with like I had, if so, turn over a new leaf, put it for two weeks on trial and let us hear the result. See to it that your day man does his duty. Give the night man a fair chance.

Speak get thy, 'tis better far

To rule by love than cuss words.

NIGHT MAN.

Cut Flower Quotations.

ED. AM. FLORIST.—Perhaps you will say when you commence to read, that I have not been a very close observer of your columns for I want to say a few words in regard to wholesale prices of cut flowers. I, too, like your Philadelphia correspondent, do not find that your quotations are anywhere near actual prices. During the present winter we have been shipping a considerable quantity of bulbous stock and be the quality however good we never get over $\frac{3}{4}$ of your quotations. For best Roman hyacinths we get \$3, nothing higher even at Christmas. Your quotations are usually \$4 to \$6. For daffodils we get \$3 to \$4, you quote \$4 to \$6 or even \$8. On hills of the valley you generally quote \$4 to \$6, we realize \$3. Now why is this? Please don't say the stock was poor for it was

not, or the market glutted for if this be the case it has been glutted all winter. I think that if growers would speak out you would hear the same story from nearly all of them. Let us have this matter ventilated if need be, and if not let us have reliable quotations by all means. In conversation recently with some of the leading commission men in New York I found that their views in regard to prices of this stock did not in any way agree with the quotations given in horticultural journals. Are commission men dishonest or do they quote abnormally high prices for effect? The prices named above are in New York. Not being satisfied with my commercial relations with the Gothamites I tried the City of Brotherly Love but the discrepancy was just as great, for one dealer there had the audacity to return me \$2 gross for 204 first rate daffodils! The growers work hard, let them have justice. A GROWER.

Nomenclature.

S. A. F. Committee on Nomenclature.

JAMES D. RAYNOLDS, Riverside, Ill., Chairman.

Roses:

ROBERT CRAIG, 49th & Market Sts., Phila., Pa.
EDWIN LONSDALE, Chestnut Hill, Phila., Pa.
ERNEST ASMUS, West Hoboken, N. J.

Carnations:

A. F. WHITTLE, Albany, N. Y.
JOHN THORPE, Pearl River, N. Y.
WM. FALCONER, Glen Cove, N. Y.

Palms, Ferns, and like Decorative Plants:

CHAS. D. BALL, Holmesburgh, Phila., Pa.
JOHN BURTON, Chestnut Hill, Phila., Pa.
W. R. SMITH, Botanic Garden, Washington, D. C.

Chrysanthemums:

JOHN THORPE, Pearl River, N. Y.
WM. FALCONER, Glen Cove, N. Y.
J. M. KELLER, Bay Ridge, N. Y.

Bedding Plants:

G. L. GRANT, 54 La Salle St., Chicago, Ill.
ROBERT CRAIG, 49th & Market Sts., Phila., Pa.
J. M. KELLER, Bay Ridge, N. Y.
A. F. WHITTLE, Albany, N. Y.

Orchids:

DAVID ALLAN, Mt. Auburn, Mass.
BENJ. GREY, Malden, Mass.
WM. FALCONER, Glen Cove, N. Y.
J. FORSTERMAN, Newtown, N. Y.

The Committee on Nomenclature.

The second part of the resolution under which the above committee was appointed (and which may be found on page 114 of the proceedings of the fourth convention), reads as follows: "That it shall also be the duty of the said committee where questions or disputes are brought before it as to the correct names of plants, to settle and decide the same." To do this would necessitate a correct botanical description of the plant in question, by means of which the proper authorities in book form could be consulted and the question decided, it probably being with this in view that the proviso was inserted in the main part of the resolution, that one of the members of the committee "shall be a recognized botanist."

But having arrived at this stage of the proceedings we are confronted with the important question, Who are the proper authorities? Are we to consider as the correct guide in the naming of roses Canon Hole, or Ellwanger, or Thos. Neitner, or whom?

In whose judgment shall we confide for the naming of our geraniums and other bedding plants?

For orchids there are the writings of Reichenbach, Warner, Veitch and others, but to whom shall we apply for the correct naming of palms and other foliage plants? Regarding ferns and allied plants there are Moore, Baker and Williams. But it would also be essential to adopt some decided opinion regarding shrubs

and trees, coniferous and otherwise, else some of the members of our society who combine the nursery and florist businesses would frequently be at a loss.

Would it not be advisable for the various members of the society to present through the columns of the *FLORIST* the names of authors they consider as authority on any special class of plants? It would undoubtedly prove useful in pointing out valuable books of reference to some of the younger members, and from the mass of suggestions received in this manner it may be possible at the next meeting of the S. A. F. to adopt some standards of reference.

MEMBER S. A. F.

Pitch of Roof for Rose Houses.

I have only just noticed Reader's enquiry (page 257) on this subject. If Reader will refer to the plans I gave in the *FLORIST* last summer he will see there what I invariably recommend, but in case he should not have those numbers to refer to I would advise him and all others to make the pitch of their rose houses $7\frac{1}{2}$ to 8 inches to the foot. Some growers, particularly those in southern cities, claim this is too much, but those who have built new houses with as much pitch as the above in some of our southern cities claim they are far better structures for the purpose than those having flatter roofs. Having tried various grades for this purpose from five inches upwards I am convinced that at least for all the northern and western states the pitch should not be less than $7\frac{1}{2}$ inches to the foot; and for all places north of latitude 41° I would advise $7\frac{1}{2}$ to 8 inches. I think if florists generally were once to try a house so built they would be convinced of its adaptability.

In regard to Reader's other question about the thickness of boards acting as a conductor of heat, would say that as far as I am able to decide I can not find it of material difference. Having tried various thicknesses from $\frac{1}{2}$ of an inch up to 2 inches I have never found any advantage or disadvantage arising from either so far as the heat is concerned; but where it is practicable to put the bearers near enough together to support the thin boards, I would prefer them to the thick ones, as they last as long or longer than the thick ones and cost less, which gives their use a double advantage. Where to be had I would always advise giving them a good coat of crude petroleum when dry, and after allowing it to soak well into the wood for one or two days give the whole inside surface a good coat of hot lime wash; and do the same every year when emptying; this serves the double purpose of destroying any insect larvae there might be, and as a preservative of the wood.

JOHN N. MAY.

The Wootton.

With us the "Wootton" has not come up to what was claimed for it. We planted 100 plants in September, and although at present in the finest health have not been able to procure blooms like those sent us by the introducer. Have cut a few very nice blooms, but the majority are the size of Bennets. But to the florist requiring a red rose, we consider it very valuable, exceedingly free, a most vigorous grower, bearing fine foliage. With us no sign of black spot.

Kansas City, Mo. SAMUEL MURRAY.

PRINT your spring trade list in the next issue of the *AMERICAN FLORIST* and mail copy for same as early as possible.

Leaves of Advice From a Limb of the Law.

(For Young Florists.)
XII.

Confound that cactus plant! What do you stand such prickly things behind your chairs for? I really believe my back has as many holes in it as a sheet of postage stamps. I feel as if Nessus and I had exchanged shirts.

You got "stuck" too did you last week? Good! Ha ha ha ha! Sat down on one of these infernal prickly machines I suppose. Doesn't feel very comfortable, does it? Worse than that, hey?

Cost you twenty-five dollars, did it? He was a shrewd fellow that, and having a bundle of bills made out on Bumble & Boggs' bill heads, in the same hand as their former statements—of course it was forged, you simply took notice of the fact that the fellow was perfectly posted in reference to the business of the house and paid the bill. In other words, you thought you had a right to presume that the man was their collector.

Yes, it is a dead loss. But let it serve to make you more careful in the future. Beware of presumptions in business matters.

There it goes again. Duce take that infernal prickly machine, this time the back of my hand received a dose. If you will only be one half as watchful as that cactus plant you will get on well enough.

Be always on the alert. Keep your wits sticking out at every pore so to speak. True, the law does permit a man to risk a presumption some times. But you had no legal right to presume that that fellow was Bumble & Boggs' collector. Had you known of your own knowledge that he was in the employment of that firm then you would have been legally justified in presuming him their collector until notified by them to the contrary.

The law presumes many things. It presumes that a man means what he says—for the law never jokes, and it presumes that a man intends to do what he does do.

But the mere fact that a blind man had written his name to a contract would not be sufficient to raise a legal presumption that he knew what he was doing.

So with an illiterate man. The law would call for additional facts to prove that such a man had not been the victim of fraud.

The law will, however, presume many things. Here are a few of them: It will presume that a promissory note was given or indorsed for a good consideration; that the person holding it is the lawful owner; that persons who take joint risks are partners; that a man who suppresses the truth utters a falsehood; that an agent is lawfully empowered to do all necessary acts in connection with the business entrusted to his care; that a person who merely signs a paper with his initials intends to execute fully; that when a man brings a suit he brings it for everything due at that date; that a person who makes trivial allegations has a weak cause; that persons owning a thing jointly are interested share and share alike; that a press copy of a letter is as good as the original; that a receipted bill has been paid; that a business man knows the law controlling his business; that if the filling in of a blank form conflicts with the printed matter, the written words are the real sentiments of the contracting party; that a receipt of money paid by installment is proof that all prior installments have been paid; that a person committing a fraud intended so to do; that any note, due bill, bond, etc. in

the possession of the person who made it has been fully paid; that a written contract embodies all the views of the parties making it; that a person who alters an agreement has a fraudulent design; that a child under seven can not knowingly commit a wrong; that a minor never ratified a contract after becoming of age, unless he did so in writing and in express terms; that when a man shows a sample he intends to deliver goods of that quality; that a lunatic was not in a lucid interval when he signed a contract; that that woman is a man's wife whom he declares so to be; that where man and wife are lost at sea the woman died first; that a man making a declaration on his death bed tells the truth.

There, those are a few of what the lawyers call "legal presumptions." But mind, they may always be overthrown by proper evidence. The law is always

MYRON A. HUNT.

ready to declare itself mistaken. This is its greatest claim to our respect.

In the olden times a king could do no wrong. But those days are gone forever.

You will find that the presumptions which the law allows are absolutely necessary for the welfare of society. If your possession of a chattel were not presumptive evidence of ownership all business would come to a standstill. And the law is a little hard-headed when it has made a presumption. It requires strong evidence to convince that the contrary is true.

The law would feel outraged were I to lay hands upon you and cry out that the watch you carried belonged to me. It would require strong evidence to overthrow the presumption that you were the legal owner of the watch and yet I might succeed in doing it. The law admits that truth may easily be stranger than fiction.

UNCLE BLACKSTONE.

Myron A. Hunt.

On this page appears a portrait of Mr. Myron A. Hunt, treasurer of the Society of American Florists, which office he has filled since the organization of the society. He was one of those who were instrumental in bringing the society into existence, and has devoted much time to the advancement of its interests, particularly in its early life when earnest work was doubly necessary.

Mr. Hunt was until recently engaged in the catalogue mail plant trade at Terre Haute, Ind., where he has an extensive range of greenhouses, but is now devoting his attention entirely to the production of cut flowers, mainly roses, for the Chicago market.

Leaky Joints.

In answer to W. H. Humfield in the *FLORIST* of February 15, I will give our method of putting in pipes. We have used most everything to caulk with and were always troubled with leaky joints until we used cement. In the first place we build brick piers for the pipe to rest on, not having them connected with the house or benches in any way; have the top of the pier level and smooth, then we put on a piece of inch gas pipe for the pipe to rest on, the pipe acting as a roller to relieve the brickwork of any strain from the contraction and expansion of the hot water pipes.

To caulk the joints we take Portland cement and coarse sharp sand (sifted through a common meal sieve) in equal parts; mix dry, then take enough for one joint and add about a tablespoonful of water or just enough to make it damp, not wet—there is more danger of getting it too wet than too dry; fill the joint half full and ram it down firmly with a caulking iron, using a hammer, not striking too hard; if it is too wet it will not pack but form mud; fill the joint full, well packed down, then smooth it up with a putty knife, using a little more water in the cement so it will work under the knife.

We have a house 75 feet long with 10 runs of pipe which have been in use two winters and have never leaked a drop. I have stopped leaky joints by driving in the old caulking until tight, then filling up with cement. When caulking in the summer we keep the joint covered with a wet cloth until filled with water as the cement sets harder when damp.

Lansing, Mich.

Murdoch, Pittsburg, Pa., seeds, plants and nursery stock; H. Cammell & Sons, Swanley, Kent, England, plants; same, seeds; F. E. McAllister, New York, seeds; Joseph Bancroft, Cedar Falls, Iowa, plants and seeds; A. C. Nellis & Co., New York, seeds; Harman & Son, South Bend, Ind., seeds; Plant Seed Co., St. Louis, seeds; John N. May, Summit, N. J., roses.

If you know of any plant which is traveling under two names report the same at once to the Committee on Nomenclature. The full committee with address of each member may be found in another column.

OUR NEW DIRECTORY of the florists, nurserymen and seedsmen of the United States and Canada is now ready. Price \$2.

News Notes.

CINCINNATI.—The next meeting of the Cincinnati Florists' Club will be held March 8.

RICHMOND, VA.—J. Harry Harvey is about to begin the erection of about 9,000 feet more glass.

ELMIRA, N. Y.—Grove P. Rawson is building three additional houses for forcing roses, carnations and violets.

ROCHESTER, N. Y.—Messrs. Ellwanger & Barry celebrate this year the fiftieth anniversary of the establishment of their nursery.

CHICAGO.—The Florist Club's annual dinner occurred at Kinsley's February 26. Mr. John Lane will spend the next three months in California.

QUINCY, ILL.—The florist at the Illinois Soldiers' and Sailors' Home, Mr. Edward Pratt, died on January 26th after a short illness of typhoid pneumonia.

NEW YORK.—Fred Gordon, the well known florist, is reported in the *New York Star* of February 13 to be insane, and confined in Bellevue Hospital.

WESTFIELD, N. Y.—On the morning of February 13 the greenhouses belonging to E. S. Bartholomew were destroyed by fire. The loss on plants was about \$1,500.

MERIDEN, CONN.—A Christmas order received by Washburn Bros. was: "A box of choice cut flowers, chiefly roses, about 10 cents worth." The order was filled by delivering one Bon Silene bud in a large box.

BROOKLYN, N. Y.—Florist Wm. Koster, 162 Even street, was somewhat startled recently by having a runaway horse break through his plate glass window, smashing it into fragments. The glass was valued at \$80.

PUEBLO, COLO.—Victor Johnson, formerly in the employ of M. D. Thatchers, of this city as gardener, is building three greenhouses—16x60, 11x60 and 11x36 respectively, to be used mainly in growing cut flowers for local trade.

MINEOLA, O.—Fire destroyed the boiler house and part of the greenhouses belonging to J. B. Roach, on January 22, causing a loss of about \$600. On February 6 Mr. Roach lost his wife at the age of 30, from consumption, after an illness of five years, at Canton O.

SIMSBURY, CONN.—Charles A. McLean, a florist here and a member of the Society of American Florists, died June 14 last, aged 38. As no mention has yet been made in the *FLORIST* I take the liberty to send this note. Though perhaps not very well known to the trade he was a man who was loved and respected by all who knew him.

ATLANTA, GA.—A chrysanthemum show will be given here Oct. 28 to Nov. 1 next by the Piedmont Exposition Company, who will erect a handsome floral hall upon the exposition grounds for the purpose. Premiums to the amount of \$500 are offered in eleven classes. Copies of the premium list can be obtained from Chas. Arnold, secretary, Atlanta, Ga.

ST. LOUIS.—A recent bill in the city council giving a park commissioner authority to give away young trees and shrubs from the Forest Park nursery has stirred the nurserymen of the city up considerably. They have presented a long petition to the council in which they ask

if the city can first tax them on their business and then enter into competition with them.

DAYTON, O.—Trade has been good, white flowers scarce. All bulbous bloom will be scarce for Easter owing to the warm weather. Tulips have done poorly. Silver spray will be the only white carnation grown here next year. J. B. Heiss is building three houses 100x16 for cut flowers. H. H. Ritter will build a large rose house. The Dayton Floral Co. is building two houses 65x18 for carnations and will heat by steam next winter.

LOUISVILLE.—Trade was very good for the six weeks preceding Ash Wednesday. Flowers have been scarce since January 1, and have been getting roses, carnations and other flowers from Cincinnati Chicago and other cities. Roses and carnations have been a failure around Louisville this winter, the quality of what blooms we did get being very inferior. There has been a lively demand owing to the great number of wedding decorations.

KILLING GREENFLY.

MONTREAL.—At a meeting of the Montreal Florists and Gardener's Club held on the 28th of January the following resolutions were unanimously adopted. Resolved that by the death of Mr. Peter Henderson of New York, floriculture has lost one of its most shining lights, and this club one of its most generous and valued friends. Resolved that copies of these resolutions be forwarded to the family of the deceased gentleman, and to the horticultural press.

PROVIDENCE, R. I.—At the adjourned meeting of the Rhode Island Hort. society held February 12 a large number was present. It was decided to give a chrysanthemum exhibition in November and committees were appointed for the ensuing year. Ten new members were added to the roll. This society was never in a more flourishing condition than at present. New members are being added to the roll at every meeting, and the finances of the society are all that could be desired.

NEW ORLEANS.—To encourage the taste and love for flowers and plants among children, a lady amateur and an honorary member of the New Orleans Horticultural Society, offers the following purses for the exhibition of seedlings and plants grown by children only, at the fourth exhibition of the society, in April. First—For the best growing seedlings, \$5. Second—For the best six growing plants, \$15. Third—For one dozen good growing plants, \$25. The regular premium list has been issued and may be had on application to Secretary Chas. Wise, corner Third and Prytania streets.

PHILADELPHIA.—Active steps are being taken at the University of Pennsylvania to establish a laboratory of plant physiology and anatomy, which it is said will be equal to any in the world. At the monthly meeting of the Penna. Hort. Society February 19, the exhibit of cut roses was particularly fine. A popular vote was taken on the merits of Mrs. John Laing and Mme. Gabriel Luizet, and of La France and Duchess of Albany, which resulted as follows: Luizet 59 and Laing 32; La France 33 and Duchess of Albany 26. There were 69 proposals for membership at this meeting, and the old Penna. Hort. Society may be considered to be on a decided boom.

BUFFALO.—At a meeting of the Buffalo Florists' Club held February 14 it was decided to abandon the project of a spring exhibition, but it was the unanimous sentiment of all present that a big chrysanthemum show should be held next fall, and an effort will be made to excel all previous efforts in this line. Fred Katoll, Jr., read a carefully prepared and interesting paper on primroses. At the meeting held February 28, candidates were nominated for the annual election which will take place March 14, and a debate on the question whether the florists' business of to-day should be classed with the professions in science and art, instead of being considered merely a commercial trade.

PITTSBURGH.—The floral decorations at the banquet tendered to President Harrison during his recent visit to this city attracted much attention and were warmly commended by the local press. In the center of the table was a cabin about 2½ feet high by 3 feet long, formed of natural bark, over which was thrown with care, less grace delicate orchids, and festoons of roses hung down the eaves and hid the chimney. Roses and orchids grew in profusion at the base, and peeped in the doorway and windows. The cabin was a fac-simile of the one in which little Benjamin Harrison opened the same pair of eyes with which he viewed these decorations. At either end of the table were immense bowls of roses, one of La France and the other of American beauties. Over the table cloth were trailed in profusion maiden hair ferns and pink orchids. A. M. and J. B. Murdoch were the florists who arranged the decorations.

SAN FRANCISCO, FEB. 7.—We have had about seven weeks of continuous rain, which has materially affected the crop of flowers which, however, have been much better than might be expected. We have had now about a week of clear weather and the markets are full of first class flowers, such as Mermetts, Perles, Gontiers, Brides, Niphetos and American Beauties; Trumpet narcissus, Harrisii lilies, carnations, violets, hyacinths, freesias, etc. Smilax and ferns are good and in abundance. The chrysanthemum season has held on wonderfully, there still being in the market some very good flowers. Prices while not extravagant are holding up well, being in general much better than at this season last year. The market is entirely bare of orchids. Azaleas are coming in in very good shape. This is the first year that the San Francisco florists have succeeded in growing Mermet roses, and it can be truthfully said that the flowers produced are on an average nearly as fine as New York's best. The people are beginning to pay prices for decorations. A number of them having been recently made at figures from \$500 to \$1,000 each. E. E. S.

CHRYSANTHEMUMS.

THE HENRY SHAW SCHOOL.

The first annual report of the Director of the Missouri Botanical Garden has been received. In it is outlined the policy which will be pursued in executing the work laid out and financially provided for in the will of the late Henry Shaw.

One of the most practical and useful of the steps indicated in this policy, and of direct interest to the trade, is the provision of scholarships for garden pupils. An announcement concerning such scholarships was issued last December, from which we give extracts.

"In accordance with the intention of its honored founder, the trustees of the garden propose to provide adequate theoretical and practical instruction for young men desirous of becoming gardeners. It is not intended at present that many persons shall be trained at the same time, nor that the instruction so planned shall duplicate the excellent courses in agriculture now offered by the numerous State Colleges of the country, but that it shall be quite distinct and limited to what is thought to be necessary for training practical gardeners.

"To this end, the following resolution was adopted by the trustees, at a meeting held on the 19th of November, 1889:

"Resolved, That there be established the number of six scholarships for garden pupils of the Missouri Botanical Garden, to be available on and after April 1, 1890, such scholarships to be awarded by the director of the garden on the results of competitive examination, except as hereinafter provided, to young men between the ages of 14 and 20 years, of good character and possessing at least a good elementary English education; each scholarship to grant such privileges and be subject to such conditions as are provided below or may subsequently be provided by the trustees of the garden.

"Until otherwise ordered, two such scholarships shall be reserved for candidates to be named by the State Horticultural Society of Missouri, and the Florists' Club of St. Louis respectively; provided that such candidates shall be given scholarships only after passing satisfactory preliminary examinations, and shall be subject after appointment to all tests and regulations prescribed for other candidates and pupils, and that if the names of such candidates are not presented by the societies designated, within sixty days after such action is requested by the director, the vacancies may be filled by him on competitive examination, as in other cases.

"Each scholarship so conferred may be held by the recipient for a period not exceeding six years subject to conditions."

The conditions are very explicitly given in the report which can undoubtedly be obtained by any one interested on application to William Trelease, Director of

the Missouri Botanical Garden, St. Louis, Mo.

The course of study outlined approaches very closely to that which we would select for a young gardener, though more time is to be devoted to theoretical instruction than would probably be acceptable to the young man commercially inclined. The Director says: "The effort will be made to give the best theoretical instruction possible in the various subjects prescribed; but it is not intended to make botanists or other scientific specialists of garden pupils, but, on the contrary, practical gardeners."

Certainly this is the nearest approach to the "training school" that the profession needs and we believe that the young men who are fortunate enough to receive the benefit of Mr. Shaw's munificence will exert an influence for good in the profession. We should have stated before that the pupils are to receive wages, for the first year, \$200; for the second year, \$250; and for each year after the second, \$300; together with plain but comfortable lodgings convenient to the garden. So that the absence of pecuniary means need not deter any young man from obtaining such a training.

COST OF PRODUCTION.

Mr. Chitty gives us in this issue some very interesting and valuable data upon the cost of producing cut blooms of carnations. There is a discouraging dearth of such data and the value of every addition is very considerable. We trust that every one who has kept a record of the number of blooms cut from a given number of plants occupying a given space, during a given length of time, will not fail to send us a condensed statement of the same that it may be added to the general fund of information. We refer not only to carnations but to any other stock. If we can establish some stated number of blooms as a fair average crop, much will have been done toward ascertaining the average cost of production. This average would not be an inflexible guide for every grower, owing to varying conditions, but it would show him beyond doubt what degree of success he was attaining, and this would be a decided help and a long stride in the right direction. The record of one house of carnations given by Mr. Chitty shows that he cut an average of a little over 33 long-stemmed, marketable blooms from each plant during the year. He gives the average price obtained for the flowers as 2 cents each, hence the product of each plant was 66 cents.

Even if we are unable to ascertain the exact cost of producing any cut flower, we will have accomplished a very great deal by establishing the comparative productiveness of different varieties. In roses, if we can secure an average of a number of houses of the same variety, where space occupied is given, and similar ones of other varieties, we will have obtained a comparison which would be of great value in determining the comparative commercial value of these roses, one with the other. And from this we can make many valuable deductions. Can any one now say whether he is deriving as much profit from his *Perles* at 6 cents as he is from his *Bon Silenes* at 4 cents? Is the comparative cost of production truly expressed by these prices?

THE WOOTTON—A box containing about fifty blooms of the rose *Souvenir de Wootton* was received from Messrs C. Strauss & Co., Washington D. C., Febru-

ary 25. All were on fine long stems with handsome foliage and none of the buds were less than 1½ inches long. They arrived in excellent condition, and were beyond criticism as a first class rose of its color, with the exception of a slight purple tinge on the edges of the petals of six or eight buds. The majority had however retained their color well. With the exception noted we can find no word of criticism for the roses sent. This additional evidence and the fact that a majority of our best rose growers find so much of value in the rose, should we believe, make florists slow to pass hasty judgment upon it. As shown by the reports previously printed the rose has defects, but the majority of those who have given it a trial—comprising the most expert growers in the country—agree that it has too many good qualities to merit condemnation without first receiving a most thorough trial.

OUR QUOTATIONS on cut flowers are again the subject of criticism. All we have to say is that the prices we quote are furnished to us by the leading commission dealers, who certainly ought to know what stock is sold at. We would ask our correspondent whether he has received the quotations which the commission dealers send to their customers, and whether they have not been very close to the prices quoted by us?

THE CHAIRMAN of the Committee on Nomenclature has received numerous favorable replies to the letter sent to the Experiment Stations, some showing great interest in the proposed work. The Experiment Stations can be safely relied upon to give much valuable assistance to the committee.

THE FUNGUS OF THE CUTTING BENCH—Mr. Geo. E. Fancourt, Wilkesbarre, Pa., writes that he has found a very efficient remedy for this troublesome pest in Hammond's "Grape dust." He states that he has given it extensive trial and that it is the only thing he ever tried that was effective.

"STEAM HEATING and crude oil as fuel" is the title of a 20-page pamphlet received from the author, Mr. J. B. Moore, Reading, Pa. In it he presents the results of his experiments in heating. Any one contemplating a change to crude oil for fuel can find much of interest in it.

PLACE ALL YOUR orders this spring with those who advertise in the AMERICAN FLORIST. Our advertisers are all reliable men, and if any prove otherwise we will take it upon ourselves to secure justice to the customer. We refuse advertisements from any we deem unreliable.

SHIPPERS should not forget that giving careless packing to good plants is like putting new wine into old bottles. It is the condition in which the plants reach their destination, and not that in which they leave your establishment, that counts.

THE ORCHID SHOW given by Messrs. Siebrecht & Wadley at the Eden Musee, New York, has drawn forth columns of admiring comments from the New York daily press. We shall have some notes upon the same later.

C. F.—We should not consider it right for the foreman to withhold a reference under the circumstances providing there was no other reason than the one stated by you.

THE "NIGHT MAN" has his little say in another column.

Catalogue Illustrations.

Speaking of illustrations, give R. J. Lombard credit for being the first to come forward and claim the benefit of official testimony as to faithfulness.

He laid on the table before the executive committee in Boston a liberal "unch of his carnation "Mrs. Fisher," together with the photographic process plate for his advertising circular. While the flowers do not average quite so large as those shown in the plate, it is yet a true and honest portrait. It is not claimed that a cut should show only average specimens. A man is certainly entitled to select his very best for portraiture. If this limit is adhered to there will be no complaint.

"Mrs. Fisher" is certainly a magnificent white carnation, there is hardly a fault to be found with it except perhaps that it shows its parentage (DeGraw) in having a stem somewhat delicate for carrying so large a flower. J. D. R.

J. T. LOVETT CO., Little Silver, N. J.

The "PLANET JR." SEED DRILLS WHEEL HOES HORSE HOES

The "PLANET JR." No. 2 GARDEN DRILL, is beyond question the best; sows the most difficult

seeds; opens, covers, rolls down and marks the next row with the greatest regularity.

The COMBINED DRILL and HOE, &c. The greatest favorite ever produced. Perfection as a Seed

Drill, or as a Plow, Hoe, Garden Rake, Cultivator or Marker. Saves labor and seed and soon saves cost.

The DOUBLE WHEEL HOE. A money maker for farmers and gardeners. Works both sides of a row at

once. Plows to or from, opens furrows, covers cultivator, hoes, rakes and has leaf guards.

DOUBLE WHEEL HOE PLAIN. Same as last, but has one pair of leaf guards.

The SINGLE WHEEL HOE is a treasure. Beats the double in some crops; is lighter. Has a Large Plow,

two Long Hoes, two Rakes, three Cultivator Teeth, and a Leaf Guard.

The FIRE-FLY SINGLE WHEEL HOE. Equals the last, except has no rakes nor leaf guard.

The FIRE-FLY GARDEN PLAW. Worth its price yearly in a garden 20x40 feet.

The GRASS-EDGER. The newest, neatest, cheapest and best machine known for edging paths and flower beds.

The 1890 HORSE HOE. The finest tool and most costly tombs that we have ever offered. Yet the result

justifies our care, as every one who sees the drill will admit. The first grand improvement is our new patent LEVER

Exchanger, one all farmers admire and which they will pay \$3.00 for, to put on old machines. The next feature

is our patent Handle Shifter, enabling one to walk to one side of his work; worth \$3.00 a day for some

crabs. Yet we ask but a small additional price for both these fine features. Why not send for full descriptive

catalogue of these and all our other S. L. ALLEN & CO. Patentees and Sole Manufacturers, useful

improvements? Free to all. 1107 Market St. PHILADELPHIA, PA.

SPRING CITY NURSERIES,

HUNTSVILLE, ALABAMA.

THE BEST SEEDS are those put up by D. M. FERRY & CO.

Who are the largest Seedsmen in the world.

D. M. FERRY & Co's

Illustrated, Descriptive and Priced

SEED ANNUAL

for 1890 will be mailed FREE to all ap-

plicants, and to last season's customers.

It is better than ever. Every person

using Garden, Flower or Field

Seeds should have it. Address

D. M. FERRY & CO.

DETROIT, MICH.

CHAS. KROMBACH, FLORIST,

MAIN OFFICE, 181 to 187 25th St., Brooklyn, N. Y.

BRANCH OFFICE, 9th Av. & 20th.

Special attention given to the care of lots in

Greenwood Cemetery.

Florists knowing of persons who have plots in

Greenwood Cemetery which they want cared for,

and who will send such to me, will be given a com-

mission of 10 per cent. on the order.

Foreign Grape Vines for Graperies.

Splendid 1 and 2 year old vines, true to name,

grown by an expert set of varieties and prices

mailed on application. HENRY A. DREER.

714 Chestnut St., Philadelphia, Pa.

Otter of Roses.

"Here y'are, gents! Here y'are!" yelled the street fakir. "Here y'are gents! The real, genuine otter of roses, right fresh from the otter, the only living animal besides the mink ox that gives up perfumes for the handkerchief! Here y'are! Otter of roses, fresh from the otter! Five cents a bottle!"—*New York Sun*.

Chrysanthemums.

Will some one experienced in growing specimen plants, give me a few hints as to pinching, and general treatment, after leaving cutting bed up to time of disbudding? A. M. P.

A WHOLE PAGE IN THE FLORIST will cost you only \$42 for one issue and in it you can send your spring trade list to every wholesale buyer in the United States and Canada. We can do you more good for less money than a list printed and mailed by you. If your list will go in a space of one half page, it will cost you but \$21. Send in copy at once for March 15 issue, not later than March 8.

OUR NEW TRADE DIRECTORY is now ready. It gives a complete and accurate list of the florists, nurserymen, and seedsmen of the United States and Canada, designating the special branch of the trade each one is engaged in. Price \$2.

To give the FLORIST your fullest support, confine your orders as far as possible to those who advertise in its columns.

SPRING BULBS.

TREES

Best sorts, New and Old. Fine blocks of home-grown red & dw't Pear, Plum, Peach and Apricot, on peach, on plum and Mariana roots; Cherry, Quince, Apple and Crab grafted on piece roots, on Whole Roots, and Budded; Mulberries, Grapes. Small Fruits, Roses, Evergreens, Ornamentals, Root Grafts—Everything. No larger stock in U.S. No better. No cheaper.
PIKE CO. NURSERIES, LOUISIANA, MO.

The Spider Lily.

On the nomenclature question, how is it that the catalogues do not agree on the botanical name of the "Spider Lily?" Some have it *Pancratium Caribbeum*—in fact most of them, and some *Pancratium calathinum*. Are both right? Chatham, N. Y. R. E. STUMPHLET.

[As was shown in the FLORIST recently the name Spider Lily has been indiscriminately applied to a number of the *pancratiums*.]

Musa Ensete.

Noticing recently some notes about *Musa ensete*, will say that I have one now showing fruit stalks. It is about 3 years old and about 30 feet high, measuring 8 feet and 6 inches in circumference at the base and I have cut some leaves 17 feet long by 3½ feet wide. G. M.

Minneapolis.

MUSHROOM SPAWN.

Best Imported English Milltrack.

Gardiner's Genuine English Milltrack Mushroom Spawn.

John Gardiner & Co. make a specialty of genuine English Milltrack Spawn. Why waste your money on doubtful quality, when you can buy the genuine English Milltrack at a reasonable price?

Can be thoroughly relied on to produce a fine crop of the best Mushrooms. Specially prepared for our trade by one of the most celebrated growers in Worcestershire.

Four importations a season—always fresh and unsurpassed in quality. The price commends itself.

By mail, post-paid, 22 cents per pound; five pounds for \$1.00. By express, at customers' expense; ten pounds for \$1.20; fifty pounds for \$5.00. Write for special prices on large lots.

FRENCH SPAWN.

In 2-lb. boxes, by express, 80 cents; ten boxes \$7.00, twenty-five boxes \$15.00, fifty boxes \$27.50.

NOTE.—For culture of French Mushroom, see pamphlet "Mushroom Culture," by Vilmorin, sent free on application with every order for spawn.

For culture of "English Milltrack" Spawn, see our pamphlet "Mushrooms for the Million," free for stamp with all orders when requested.

F. A. BALLEE, Bloomington, Ill.

New Jersey to the Front.

February 14 the representative team of the New York Florists' Bowling Club visited Summit, N. J., for the purpose of giving an exhibition game and to give the young men of Summit and vicinity a few points in bowling. Arriving early in the afternoon they proceeded at once to get into practice and become familiar with the alley. After a recess at 6 p. m. a game was arranged between six of the New York team and a like number of Summit men. The accompanying score will show how well the New Yorkers succeeded in educating the Summit boys. They are very apt and "catch on" early.

First game New York	First game New Jersey
J A Penman . . . 130	J N May . . . 128
W S Allen . . . 111	J Barnes . . . 107
C B Weathered . . 103	A Attwell . . . 109
C P Anderson . . . 101	G Sawyer . . . 113
J Miesom . . . 102	B E Finnegan . . 115
C H Allen . . . 92	G L Graham . . . 98
..... 636 670
Second game	Second game
J A Penman . . . 116	J N May . . . 137
W S Allen . . . 116	J Barnes . . . 104
C B Weathered . . 109	A Attwell . . . 117
C P Anderson . . . 115	G Sawyer . . . 106
J Miesom . . . 99	B E Finnegan . . 110
C H Allen . . . 101	G L Graham . . . 103
..... 656 686

During the progress of the game the following remarks were overheard. "I believe it's the pickles I ate at supper that's upset my rolling." "It's all on account of that pink painted celery." "Say Charlie, let's hire some of these country boys to play for us in the next game." There was plenty of fun all around, and particularly for the Summit boys. The last heard from the New Yorkers as they departed for home was: "We may not get the World's Fair after all; good night." N. J.

CYCAS REVOLUTA,

In all sizes from 8 inches to 3 ft. high, laid down in San Francisco, freight and all other charges paid.

Pot grown, well established plants, with root balls (root balls excluded), per 100 lbs. U. S. currency, \$18.00.

Open ground, well rooted, out of my Yokohama nurseries, per 100 lbs., U. S. currency, \$15.00.

Freshly collected, prime quality, per 100 lbs., U. S. currency, \$12.00.

[Orders for less than 500 pounds cannot be executed, as orders for few hundred pounds would cost too much freight in proportion.]

RHAPIS FLABELLIFORMIS.

Also laid down in San Francisco.

Fine cultivated pot plants, from 18 inches to 2½ feet high, per 100 shoots, U. S. currency, \$30.00.

The same, freshly collected, per 100 shoots, U. S. currency, \$10.00.

Hints to Shippers.

The unsystematic methods of doing business of some shippers cause much vexation and result in loss of trade. It is not my desire to attempt to instruct the readers of the *FLORIST* in all the details of conducting a successful shipping business, but merely to call the attention of shippers to some omissions which certainly result in injury to themselves.

Whenever an order is received its receipt and the amount of remittance should be acknowledged without delay. If you can not fill the order, or if you lack something which under the circumstances you deem essential to satisfy the customer, inform him of the fact at once. Also notify him when the goods are shipped, printed postal cards answer the purpose. By keeping the customers promptly informed as to these points you inspire confidence and encourage further patronage; if you neglect them, delays inspire distrust and the uncertainties of the situation are doubly vexatious. I might add that great care should be used to pack in such a manner that you can secure low express and freight rates on the goods. I get goods of a certain kind from a distant city cheaper than from one nearer to me because the goods are packed in such a manner that the freight rate is less. To make your business a success omit nothing essential to it. I. J. BYERS, Nickerson, Kan.

A Florist's "Want."

A reader sends us the following "want" adv. clipped from the *New York World* of February 2 and asks: "Can you do anything for poor Mr. B—?"

A FLORIST desires to correspond with an educated lady, under 31, with a view to matrimony; money no object; no objection to widows; photos exchanged; no agents, no triflers. Address C. F. B—, Borist, Galveston, Texas.

Well no, we don't see that we can. He seems to have proceeded in a business-like way to help himself. And as he doesn't seem to be too exacting in his requirements, his yearning heart has probably been tranquilized ere this. If you don't see what you want, advertise for it.

AUCTION SALES

of Plants, Bulbs and all Horticultural Spring Stock will commence

IN MARCH.

MICHEL PLANT AND SEED CO. ST. LOUIS MO,

THE ROSE OF THE YEAR.

CALIFORNIA'S NEW ROSE "THE RAINBOW."

— THE ROSE FOR EVERYBODY! —

**The most Vigorous, Free-Blooming, Forcing
Rose ever Introduced.**

A most lovely Rose of a deep Mermet pink, striped and splashed in the most fanciful way with deep Gontier color, but only enough to add to its beauty, and with base of petals of rich amber. Flowers well carried on long stiff stems, of the same shape as Gontier but most decidedly larger, sweeter and of greater substance.

Remember, "**THE RAINBOW**" is a sport from Papa Gontier, one of the most popular Winter-bloomers. It will do well with everybody. It surpasses its parent in freedom of growth and bloom by far. Experience has taught, that sports from Winter-bloomers have proved to be Roses most fit for the same purpose: for instance, The Bride, Duchess of Albany, etc.

"**THE RAINBOW**" is only offered to the trade. Cut flower growers as well as nurserymen will certainly see the advantage of getting a new American Rose which offers such inducements to each of them.

I am ready to book orders now. All orders will be filled strictly in rotation, commencing July 1st, 1890, at the following prices:

1 PLANT, \$1. 12 PLANTS, \$10. 100 PLANTS, \$75.

The plants will be from 3-inch pots, placed out of doors during June, so as to stand shipment well.

JOHN H. SIEVERS,
25 POST STREET,
SAN FRANCISCO, CAL.

"**THE RAINBOW**" received the highest award in the gift of the California State Floral Society at their last Fall Exhibition,

Killing Greenfly.

For the benefit of fellow sufferers I give my experience with various methods of fighting the aphids.

First I procured two bales of tobacco stems and packed them about the hot water pipes. After waiting several days for results I came to the conclusion that the treatment was good for the little fellows as they seemed to be in a thriving condition and possess unimpaired appetites. Then I tried evaporating tobacco water, dropping red hot bricks into pans of water in which stems had been soaked. Result: Most of those that were infants at the beginning of this experiment had become grandmothers. Then I constructed a tank on the outside of furnace and ran a pipe from it through furnace and part of the into greenhouse; this evaporated about ten gallons of tobacco water per night. Kept this up for about a week, meanwhile matters began to look rather serious for the aphids as their natural food was becoming rather scarce and their families were still increasing. Next I procured a large iron kettle, filled it with tobacco stems, rammed them down hard, put a small quantity of coal oil in the center, set fire to the coal oil, then covered the top with earth about three to four inches deep, leaving a hole in the center for the escape of smoke. This caused the stems to burn slowly, giving a small volume of smoke for a long time. Found this method very satisfactory. It does not injure the plants if well syringed and it is not good for the aphids.

Pemberton, N. J. A. ROSBACH.

Orders Booked Now for the New COLEUS, CHRYSANTHEMUMS, ETC.

New Coleus **LOTTE GREEN**, of sturdy growth, very dwarf in habit, desirable for bordering and carpet bedding. It never goes up stairs, and is of many colors; footstalk and center of leaf pearl pink and purple with various other tints shading off to red and brown with a green border. Four years tested, and brings the answer every time: Try it. 25 cents, each; \$2.00 per dozen.

VERSAHAFELTII, J. red, a variety raised by us last season is similar to old Versafield, but a stronger grower. 25 cents each; \$2.00 per doz.

NEW CHRYSANTHEMUMS raised by Sheldrick, **GOLDEN BEAUTY**, a splendid grower, of dwarfish stock habit, of the Chinese type, and richest golden yellow; probably the finest yellow in existence. 25 cents, each; \$2.00 per doz. **PURPUREA**, a colossal grower, making fine show plants; flowers of medium size, very numerous and of perfect form. Fine purple, a scarce color, and before we get out 25 cents each; \$2.00 per dozen. **RED BIRD**, a distinct novel variety, of vigorous growth dwarf spreading habit and fine pom-pom style; very pretty, flowers abundant beautiful bright cherry red, yellow center; there is nothing like it. Scarce. 50c each; \$4 per doz. Ready for delivery April 1st, by mail free.

Also rooted cuttings of **QUEEN FEVERFEW**, **FUCHSIA**, finest varieties mixed. **BELL-TROPE** White Lady, Lady Versalaise, etc. **Stevia**, tall, dwarf and variegated.

Laetanas in variety, \$1 per 100; \$5.00 per 1000. **Ageratum White Cap**, Cape's Gem, Everblooming "forget-me-not", from cold frame, 40c per 100. **Wormwood Verbenas** in splendid variety, \$1.25 per 100; \$12 per 1000.

Carnations Robert Craig, DeGraw, C. King, etc., \$1.50 per 100. Ready March 10 to 15.

Chrysanthemums, stock weeded down to 150 varieties including most of the best new and older kinds, all styles and colors, strong. Diana, F. Henderson, Christmas Eve, good plants, well started, \$2 per 100; \$15 per 1000, not sold.

Begonia Sandersonii, everblooming scarlet, other sorts in limited quantities, from 25¢ each, \$3 per 100. Rooted cuttings, \$1.50 per 100.

A few thousand **Parisian Beauty** Pansies, small plants suitable for stock, 20c per 100.

Hollyhock, double, fine strain seedlings, nice plants, 25 per 100.

10000 Tuberoses, fine strong bulbs, tall size, \$2 per 100; 2nd size, \$1.25 per 100.

1000 Concord Grape Vines, 2 year, \$4.00 per 100; 3000 1 year, \$2.50 per 100.

500 Moore's Early, 2 year, 85¢ per 100; 1000 1 year \$4 per 100.

1000 Warden, 1 year, \$3 per 100.

1000 Wilson Blackberry Plants, 75 cents per 100; \$1.50 per 1000.

500 Early Cluster Blackberry, \$2 per 100.

Heating Pipes.

I am putting up a house for cut flowers and will heat it with hot water. I intend to use 1½ or 2-inch wrought iron pipe instead of the 4-inch cast iron pipe. The heat will be supplied by an ordinary hot water boiler.

Will some florist who has used the smaller pipe give instructions as to the best way of arranging them and state his experience with them? If a house requires 800 feet of 4-inch pipe to heat it to the required temperature how many feet of the smaller pipe will be required to do the same amount of work? Where should the expansion tank be located and what should be its dimensions?

A BEGINNER.

Stopping Leaky Joints.

A few weeks since, just as a cold snap was coming on, a joint in the hot water pipe began leaking badly, and it was in a position extremely difficult to get at. We immediately secured a roll of electric tape, wound the tape around the leaking joint and succeeded in effectually closing it. This tape is I think coated with rubber and is quite adhesive. It is an excellent thing to mend rubber hose with. Its name is, I think, given it because electricians use it for insulating wires. Polo players also use it on the handles of their sticks.

WASHBURN BROS.

Meriden, Conn.

Correction.

Allow me to make a correction in my article on "Improvement of greenhouse flues" in your last issue. I there stated that the whole arrangement did not cost \$3. This is an error, as the total cost was about \$12. Even at that figure the improvement is as cheap as it is effective.

W. R. SHELMEIRE.

Florists' Letters.

Emblems, Monograms, Etc.

These letters and designs are made of the best materials, wired on wood or metal frames, having holes drilled in them to insert tooth-picks, by which they are fastened to the design.

Give them a trial. You will find these goods to be superior to any in the market.

Send for Sample, 2-in. purple, per 100, \$3.00. Postage, 15 cts. per 100.

THE FLORIST was started as a 16-page paper. Soon it was found necessary to issue an occasional 20-page number, and before very long 20 pages were given in each issue, with an occasional 24-page number. Later on 24 pages was established as the regulation size, with a 28 or 32-page number at intervals as necessity arose. This issue contains 36 pages, four more than any previous issue, and twenty more than the earliest issues. The possibility of a weekly issue does not seem to be very distant. THE FLORIST has not yet attained its growth.

The Education of Young Gardeners.

[Read before the Gardeners' and Florists' Club of Boston by Prof. B. M. Watson, Jr., of the Bussey Institute.]

GENTLEMEN:—The subject of technical education is at the present time claiming much attention, by it is meant teaching young men and boys practical work in much the same way that medicine or law is taught. These two professions are good examples, because it was not so very long ago that law and medicine were taught by methods very like the apprenticeship system in the trades and arts. A man now goes to a law school or medical school where formerly, although not always bound as an apprentice, he nevertheless entered the office of a lawyer or doctor, in some cases becoming a member of the family, and obtained his education not only by reading with them but also by helping as well as he could in the simpler work of his employer.

A machinist or carpenter could only gain the requisite knowledge of his chosen industry by "hiring out" or "being bound" to a master smith or carpenter until within a very short time; indeed although now certain opportunities are offered in the various technical schools, comparatively few lads are so placed that they can take advantage of the offer. In the same way the education of young gardeners has been and is almost totally given over to the apprenticeship system, and many a good man has been turned out thereby.

The questions naturally come up, what is the difference in the two methods of obtaining an education, and what advantages does each possess? Just how can a fair lad in moderate circumstances acquire the art of plant growing in the best way and in the shortest time? Can any help be obtained by watching the methods practiced in other trades and professions? Can any advantage, however slight, accrue from seeing, that in other branches of labor, not so very remote, the methods of acquiring practical knowledge are gradually changing and that at any rate a certain amount of time is saved even if nothing more is gained.

It may be well to consider before attempting any further comparison, what are the requirements? What can be expected in the way of an education in gardening by a lad of 15 who wishes as soon as possible a situation which requires either an all-round knowledge of trees and shrubs, flowers and vegetables in common cultivation, or the special knowledge called for in growing some one or more of the classes of plants important in trade? There is no need to tell an audience like this that schooling in the ordinary sense alone can not make a gardener, either "all-round" or "special," some times a gardener, maybe born like a poet, but to most, experience is the

mother who teaches. How we can best utilize the experience of past generations of gardeners is part of education of the gardener of to-day. How can the store of learning of men who have been growing plants all their lives be gained? How can our lad of 15 acquire this information? How can he at the same time learn to observe the habits of plants, learn to reason, to see the cause and note the effect, and so, while improving his own power, maybe add something to the by no means too large fund of general information relating to plant growing?

First and foremost comes a practical knowledge of plants, not their names alone, not their habits only, but that also which is often lacking in practical men, an as intimate acquaintance with their structure as is possible. Here a comparison between the practice of medicine and surgery and the practice of gardening may not be inappropriate, notwithstanding the great difference in the importance and complexity of the two branches. To me it seems that if we could make use of the means of research and of imparting information employed by the medical profession a great step would be gained, not only in immediate results but also in the advancement of our art. The doctor is called upon when his patients are sick; the first duty of the gardener is to keep his plants in health. One cause of illness is undoubtedly the more or less unnatural methods of living which prevail in civilized countries. There is no doubt about the highly artificial manner in which plants are grown. Our plants collected from all quarters of the globe, growing under widely different conditions of soil, temperature and water supply, are forced by us to grow in that locality which suits our convenience. We do our best to imitate the natural surroundings, and that is gardening—keeping the plants in vigor and health often under adverse circumstances, a work not so very unlike that of the physician and surgeon. As in the education of the young doctor the anatomy of the body is first explained, so in the education of the young gardener I would begin with the structure of the plant. He should be given a thorough grounding in botany. He should be taught the different parts of the plant and their offices. He should study the relations of the higher plants to each other and should know something of the lower forms of vegetable life. He should be able from his knowledge of the relationship of plants to determine a name in a flora or manual and if possible, if his inclination runs in this direction, let him make an herbarium or collection of dried plants carefully named and labeled, such work gives methodical habits and assists the powers of observation. Inculcating habits of observation I consider of the first importance in any plan which may be proposed for our purpose.

There is no better study than chemistry to promote such habits.

You may think perhaps I am laying out too much work for our boy, but please do not misunderstand me. I do not want him to study botany to be a botanist, or chemistry to be a chemist, any more than that while he is at school he should study arithmetic and algebra to be a mathematician, or reading and writing in order to become a writer of books. Botany and chemistry bear the most intimate relation to agriculture and horticulture in all their forms, and I maintain that any knowledge of either of these subjects will be of the most material and direct help, while indirectly they will cultivate those powers of observation without which progress in our art is well nigh impossible.

It goes without saying that the better schooling a boy can have the better he will be fitted to begin his chosen calling. Something depends on the boy, one should not plan to "spend a thousand dollars on a hundred dollar boy," as has been said in another discussion on educational matters. It would be folly to say that a college education is in any way necessary to make a good gardener, but it would be still more foolish to say that any form of education is a hindrance.

Home training is an important factor in the make up of any boy and many of the matters I have touched upon may be impressed upon him by his family and friends; the knowledge of plants which the son of a plant grower is likely to obtain without effort will stand him in good stead when he begins his real work. When this time comes what is the lad to do? Two courses are open to him; he can hire himself out to some florist or nurseryman, or he can enter one of the schools which have lately been established for teaching agriculture and horticulture. It remains then to consider what advantages are to be gained by choosing one method or the other. The old apprenticeship system, in one form or another is certainly and for good reasons the favorite at present. We hear of few boys going to agricultural and horticultural colleges to get the practical knowledge of which I am speaking. The boy hires himself out at so much per month and presents himself as ready to do any work about the place; under almost all circumstances this work naturally at first is of the roughest description, or at any rate simple and without much variety. He runs the fires, attends to the bringing in and mixing the soils, washes the pots and keeps the premises neat and orderly. He gets besides some experience in propagation and in handling the more easily grown plants. Much depends upon the sort of establishment which he enters as to the range in subjects, much depends upon the master as to the chances which he has to make the most of his opportunities, more depends upon the boy as to his making the most of what is set before him. The important thing for the boy to obtain at this period is a thorough understanding of what is going on about him and reasonable chances to take part in all the various operations, if he can learn to grow roses and carnations in good shape and understands the various steps, so much is gained, not only in that particular line, but so much has been done towards helping him to grow other plants. The boy does not yet know perhaps just what line of work is best suited for him, he does not know whether it will be trees and shrubs, fruits, flowers or vegetables, any one or all, whether he will become an outdoor man or a green-

house man; it must be a part of his education to give him opportunities to make this choice intelligently. The important point to consider here is that no knowledge of any one class of plants will ever come amiss to the good gardener, to the man for whom there is "always room at the top." I insist, that in case the apprenticeship system is chosen, this always should be kept in mind, viz.: that in educating a gardener it is an all-round education which is best, that no one branch is enough, that it is best to get first an even imperfect acquaintance with a range of subjects and then make the specialty later. The boy or his parents must bear this constantly in mind. It is hardly possible to gain great proficiency in any one branch without having first had experience with large and different classes of plants. I know changing plans presents many difficulties, but these can be met and overcome by a boy who really strives to win his way. I should say a year or two at some private place at first, or the beginning might be made at a nursery, then one or two seasons at a sales place, choosing, in accordance with his inclinations, one where cut flowers and greenhouse plants or trees and shrubs were principally grown. A capable boy, one who took to the business, ought to be able at the end of five years to undertake the management of a small place for himself or another; it would however be still better for him to engage as under gardener and for another five years continue his studies under experienced direction.

In other words to make the best use of the apprenticeship system at least five years must be spent without regard to wages; a boy could probably support himself in part and this would be a necessity in many cases, but wages should not be considered except as of secondary importance for at least that length of time, after which the young man should look for fair pay, but should never forget he is still getting "the experience which teaches."

Is there not some way by which a certain general information about plant growing can be obtained in less time? Can not the first five years of routine work be shortened? It seems so to me taking a fair specimen of boy, one neither extremely bright nor very dull. I should say that the same amount of preliminary training could be accomplished in two years, or at any rate three (and in certain cases even in one), and moreover, that this work could be done in a more satisfactory way. This would be by a proper use of the agricultural and horticultural schools and experiment stations which are established in various parts of the country. The element of time could I'm sure be very much abridged, but it would be at the cost of expense. Education must be paid for in some way, the boy must be supported during his period of study, and although he might not be compelled to pay much for his tuition, still he will not and ought not to expect to earn any considerable sum during this time. I am well aware that agricultural and horticultural schools as they now stand do not commend themselves to farmers and gardeners. This is apparent not only from the fact that they do not often send their sons, nor often advise young men to seek this form of education, but also it appears in the tone of the papers which represent the practical plant growers. No complaint is to be made, nor to my knowledge has been made by the schools for this state of affairs. The schools as well as the plant growers know very well that in some

ways they do not, are not able to come into competition with the present order of things. The schools with us are largely experimental, they are feeling their way, they are teaching themselves to find out and then impart the instruction which is required; but even as the schools are today it seems to me that in the earlier stages of the gardeners' studies they might be profitably employed. There is a large amount of simple work in gardening, it must however be understood and without knowing these elements no one can become a proficient. I refer not to the care of fires, pot washing and the like, but to preparing and mixing soils and understanding why what may be very good for out-of-door work is not right for the greenhouse, and why the care given to soils for growing plants under glass is not necessary in the open air. I mean work like propagation, either simple or more difficult, the principles of which can be learned in a short time if properly presented, here the advantages of a well organized school are very apparent; a boy hires out to a greenhouse man, he can learn only directly and with absolute practice to propagate a limited number of tender plants, mostly from cuttings, if it is a salesplace he can handle roses, carnations, violets and a few other plants, if it is a private place the list would be more extended, but is not likely to include, beyond the greenhouse and frame yard, much except vegetables where propagation would be required, he will know very little of trees and shrubs, fruits and herbaceous plants in this particular. As in propagation so in many other matters, the actual practice must be limited where any question of working for wages holds, while in an even fairly well equipped school all routine matters of this simple nature can be given with quite extended practice in detail.

It is time to say something about the other advantages which a school should be better able to give than any private or salesplace. Here courses in botany in all its branches, with special reference to the needs of plant growers, could be given. Chemistry can be studied not only for practice, but for its most intimate relation to practical work, the true value and use of manures, the composition of the different soils and the processes which go on in the complex relation of soil, air and moisture to plant growth. Johnson in "How Crops Feed," says in reference to cultivation in the open ground, "through the soil alone can we influence plant growth," a most important matter to the practical outdoor and to the greenhouse man who wishes to make every square inch of his costly structure give its best return in dollars and cents. Cryptogamic botany, a most interesting study, can hardly be understood without competent instruction; this bears directly upon the diseases of plants and every practical man knows we are getting pretty near the time when something must be done to check the ravages of growths so minute that it is difficult to detect the offender. Entomology is another subject of the greatest importance to the gardener who strives for the best. How can a lad working for his bread and butter expect to make headway in these studies where even the specialists are at fault? Instruction in surveying, a most useful study to the practical gardener, would form a part of such a course.

I say nothing of those advantages which such a school might offer in the way of instruction in farming and attendant subjects, nor of the highly important matter of the discipline and mental

WEDDING DECORATION FOR DESCRIPTION SEE PAGE 326, LAST ISSUE.

training which would result from the lad's intercourse with men trained to present their branches in a fit and proper way. What not to believe, or at any rate, what to be in doubt about is something which might well enter into the education of a man in affairs about which so little is known scientifically as about agriculture and horticulture at the present day. You will perhaps notice that I have said nothing about various studies often offered in agricultural colleges. It seems to me that it is the all-round nature of the studies in some of these schools which have put farmers and gardeners out of the habit of sending their sons to them, that they distrust the practicality of the special form of instruction which they require where so much is to be obtained.

It is far from my purpose to say a word against education in any form, but this problem confronts us, this state of affairs is beginning to be noticeable, that while abroad such schools exist and are attended by those who need this technical education and who on graduation devote themselves to rural affairs, here it is not the case; we have the schools, but while some farmers and gardeners are turned out, others, the majority perhaps, betake themselves to other pursuits, they are school teachers, doctors or ministers, they are not farmers and gardeners. It is not surprising under the circumstances that practical men write and talk against educating their children in schools which were established largely for their use. The fault is partly with the schools and

partly with the farmers and gardeners, the schools must be made more practical and plant growers must send their sons, a better understanding must be established, the schools must be encouraged and a fair trial given to a somewhat different method of teaching than has heretofore obtained in these matters. It may not be practical to establish such a school as I have sketched, but if such a school was established there would be no doubt about its practicality.

Gentlemen, I thank you for the honor of being asked to come before you and for the attention you have given me. There are two sides to almost every matter of importance, and although I have this evening tried to give you a fair statement of the possibilities in educating young men in our profession I have advocated that method which seems best to me. More might be said and better said on this most important matter, the country has not yet seen the days of its best gardening. You and your comrades in other cities have done wonderful work and as I understand have far outstripped the flower growers of the Old World in many ways, but this is not the case in all branches of the art. The days are yet to come when gardens and greenhouses are to be common through the country, these days are fast approaching and we may at any rate take our part in preparing for the gardening of the future by devising some scheme of education by which not only the art of gardening shall improve, but by which the rising generation of young gardeners shall profit.

Self Education.

There have been many men who have educated themselves, or at least partially, and the way they have done it is by careful, persistent digging at odd moments during the day and evening. Others can do as much if they have the proper amount of application. I do not advise any one to study to that extent which will interfere with their business or sleep.

J. H. H. has asked for some one to outline a course of study to cover from four to six years. No one person is competent to arrange such a course, but I propose to give a few suggestions in this line and you can take them for what they are worth.

In the study of botany, which is of the utmost importance to the trade, the first book to be thought of is Gray's "New Lessons and Manual of Botany," which is the standard, to be followed by Thome's "Structural Botany," at the same time "Henderson's Handbook of Plants," Fuller's "The Propagation of Plants," and "Origin of Our Cultivated Plants" can be read and certain parts of them studied. Common sense will tell you which parts.

In entomology Packard's "Guide to the Study of Insects" is a good book to at least read and have for reference, also a copy of "Insects Injurious to Vegetation" by any of the recognized authorities in the section of country to which you belong. Many of the State Agricultural Reports contain valuable articles

on these and other subjects of interest to persons in the trade.

There are hundreds of books on subjects relating to the trade which any one, young or old, can profitably read, but the list would only confuse "the young man with the interrogation point," so we will give no more, trusting that this will be enough to start with.

Do not get into a rut, as some men do, and laugh at books, for you will find that if you do not use your brains you will become more and more like a machine every day you live. Thoughts turned in the right direction are golden, but if they are allowed to run always in one rut they are worse than wasted, and remember that you are never too old to learn and that with application and perseverance old dogs can be taught new tricks.

ALFRED B. COPELAND.

Springfield, Mass.

Buying on the Co-operative Plan.

BY DAVID BEARNS.

[Read before the Florists' Club of Philadelphia.]

Can this club be of any benefit to its members by buying supplies on the co-operative plan? If this club could devise a practical plan of buying supplies for its members co-operatively, cheaper than they can individually, it would not only be a benefit to its members, but it would greatly benefit itself also if so managed as to give them a direct benefit—some good that they could feel at once, it would increase its own usefulness and make it important for each member to take a keener interest in its welfare.

Every one will admit that if you go to purchase a large quantity of anything you can get better terms than for a small amount, although keen competition has made dealers in other products besides our own cut the margin very fine between the price for a single article or by the hundred, still a committee of this club composed of some of its very shrewd members who have brought buying down to a fine art could undoubtedly do better if, for instance, they were to bargain for a thousand boxes of glass or a thousand tons of coal than any member could do who only wanted a small amount of either article.

Co-operation in this country has oftener been resorted to by the producer than the consumer, but in the old country (I mean by that, the part I have had personal knowledge of—England and Scotland), it is just the reverse; there, alike in large cities and small villages, you find co-operative stores where nearly all the necessities of life are sold, and the net profits whatever they may be divided among the consumers. The great civil service stores in London are a good example of the success of this way of doing business; started originally among the employees of the government for their own benefit, their customers now include all classes and their dealings run into the millions annually. I don't know on what system they are run, but co-operative stores there are conducted generally on what is called the Rochdale plan. The members subscribe a small sum each—say five pounds, which constitutes the capital of the concern; they elect officers, who put in a paid manager and whatever help is necessary to run the business, which is on a cash basis, both buying and selling; this they claim is the greatest secret of their success. When a purchase is made a check corresponding to the amount paid is given and a settlement is made at stated terms, quarterly or yearly as the case may be, when, after allowing

interest on the capital they divide the profits, which often amount to 10 and even as high as 20 per cent; and they don't charge higher than other stores, in fact they try to be a little under to induce non-members to purchase, who generally receive about one half as much as the members. Now I have not given you this plan with the idea of adopting it here, but just to set the members a-thinking of some feasible plan to benefit themselves and the club at the same time, and here I might say the surplus in the treasurer's hands might be made of more use to the members in this way than any other.

The difficulty, as it appears to me, is the amount of work which will be necessary. But if we could get a committee of these shrewd buyers willing to give a little time and labor for the good of the club, it could undoubtedly be managed, and not only supplies bought but we might look forward to the time when the club could undertake to work out new ideas for the common good of all, a work which is at present hard on the individual, especially when as soon as he has shown it is practical, every one appropriates it for his own use without giving him either honor or profit.

Just to show how this might work, one of our members whose brain is always busy, trying to devise some means of saving labor or expense, has at present the notion that oil would be a cheaper fuel than anything we can get around here. Now if we had a committee who would give attention to just such things as this and if the idea is practical they could work it out better than any single member, and if it were generally adopted they could buy the oil cheaper in such quantities as would be required, or find better ways of transporting it than exist at present; in fact they might be the means of bringing it in pipes and thus be a benefit to the city as well as the club and its members, helping to hasten the time when we can co-operate to help one another, and enjoy some of the benefits promised to those who are to live in the twenty-first century, instead of as at present trampling under foot our weaker brethren in the struggle for existence.

A Word for Detroit.

The notes from Detroit in the last number of the *FLORIST* seem to me to give a rather unfair impression of the state of the flower trade in that city. Miss Taplin's criticisms are usually just but I think that in this instance she has been a little too severe on the Detroiters.

There are no doubt phases of Detroit's flower trade that have not come to my notice, but as a wholesale shipper of cut flowers it has been my fortune to do a considerable business in that city and my experience has led me to look upon it as one of the most progressive of the western cities in taste.

The demand in Detroit for cut flowers of the best grade I believe to be fully equal to that in any city in the west of the same size. That the florists there are capable of turning out tasteful and artistic work would not be doubted by any one who visited their exhibition last year and observed the prize mantel and table decorations there shown, and conclusive evidence of the taste of the public was shown by the admiring throngs who crowded about those beautiful examples of the florists' art. Cheap work there was too, I admit, but where is the city where cheap work is not found and tawdry designs not demanded? It certainly

will not do for a representative of New York City to "throw the first stone" while the memory of that fearful and wonderful display on the stage at the Philadelphia Convention lasts.

WM. J. STEWART.

Hydrangea (Ramulus Coccinea).

This new and valuable acquisition to the list of hydrangeas must certainly create a sensation in the horticultural world as soon as its merits and value become known. It is without doubt the most valuable variety of all hydrangeas yet introduced and will certainly attract universal attention and admiration.

This variety is quite distinct from all others from the fact that the foliage stems and stock are of a dark plum color while the flowering branches are of a bright transparent red (hence the name coccinea). The trusses as well as the florets are larger and are of a much brighter rose color than those of the well known variety otaksa.

Being of a very deep color, it will be found especially valuable for early forcing and for Easter trade, as it does not lose its brightness to so great an extent through forcing as does the variety otaksa, which fact of itself makes it decidedly valuable. It is also a very free bloomer, producing fine large and magnificently formed trusses upon every shoot, as is shown in the accompanying cut of a plant one year old.

FRED'K SCHLEGEL.

Rochester, N. Y.

—*Hydrangea ramulus coccinea*, or, as it is quoted in this year's catalogue of Messrs. Ellwanger & Barry, of this city, "New Red-branched Hydrangea," I have been watching for the past few years with considerable interest, ever since the first flower of it came under my observation, which was of really immense proportion on a rather small plant. I first saw it at the place of the above-named gentlemen and also last year at Mr. F. Schlegel's. In such an extensive establishment as Messrs. E. & B.'s, generally little attention is given to the production of plants suitable for immediate sale while in flower, and as hydrangeas usually bloom in April or May, just in the very busy packing and planting season, perhaps all plants then under glass get no more care than the necessary waterings and probably less of that than really required, and everybody knows that hydrangeas, just before and while opening and developing their flowers, require considerable moisture to perfect good large heads. With all these drawbacks *ramulus coccinea* was very large and remarkably free blooming. My attempts to find out anything about its origin have not been successful up to date; probably some of our eastern florists could do better, for, if I am informed right, there is a red-branched hydrangea grown in the vicinity of New York, at least my brother stated it as a fact when I called his attention to the plant two years ago, but under what name it goes there I do not know for certain. Messrs. E. & B. also have another red-branched variety named *H. ramulus picta*, of which they do not think so much at present, but it may on further trial recommend itself; now it remains to be seen whether the eastern one is the same as ours, or the latter named, or still another.

I have now a few plants from the East and also a few of the Rochester plants and will see this summer in what respects they differ. Can not Mr. Falconer give us any information concerning this plant? All I could find out was that some years

HYDRANGEA RAMULUS COCCINEA

ago among an importation of new shrubs, etc., from Europe a hydrangea with the above name attached came in the possession of the firm and the shrubs and plants were planted out in their specimen or experimental grounds. Some time afterward Mr. W. C. Barry gave orders to pot a few plants of each and every variety of hydrangea (of which they had at the time a rather large collection, many of them of the japonica type), and to take them into the greenhouses to ascertain their respective value under glass. The result was, *ramulus coccinea* showed so many superior points over all others that the firm concluded to propagate it; still, as is their habit, they would not offer it until further trial. The plant differs from other varieties principally in the color of the wood and in the size of each individual floret as well as in the greater circumference and size of the flower heads. The color of the wood, before it becomes brown and hard, is a very bright purplish crimson, terminating, toward the flower stems, just under the heads, into a clear bright crimson, which adds greatly to the beauty of the flowers. What I have seen of the plants would warrant the assumption that almost every growth will perfect a flower head, even if the plant was not ripened off in the fall of the previous season, so freely are the flowers produced on all sizes of plants. It also appears that the color of the flower is of a much clearer pink and retains that color much longer under glass than does either *H. hortensis* or *H. otakasa*. In addition to these favorable points

may be mentioned the low branching habit and consequently dwarfer appearance of this variety. It certainly is, as seen here in R., as much of an improvement over *H. otakasa* as this latter is on the older *H. hortensis*, and in the opinion of some of our best men here, the difference is much greater in favor of the new red branched.

J. B. KELLER.

Society of Indiana Florists.

The Society of Indiana Florists had a very profitable and interesting meeting at the State House, Indianapolis, February 26 and 27.

The President of the society M. A. Hunt of Terre Haute, opened the meeting with a most interesting and admirable address. Space will not permit even an outline, suffice it to say however that our presiding officer took high ground on all questions pertaining to the elevation of our business.

Mr. J. D. Cox of Crawfordsville gave some most excellent reasons for organized action in a well prepared and thoroughly good paper. His reasons and argument for florists to organize was a convincing piece of logic, would that the members of our profession throughout the country could but read it. Wm. Berterman gave a most interesting account of the plants and plant life as seen on a recent trip to New Orleans and parts adjacent.

In the evening Mr. Pierre Van lan Deghem, of Purdue University gave an illustrated lecture or talk on the

fertilization of the orchidaceous family. The talk was replete with interesting and valuable points on the little understood methods of fertilization of this valuable race of plants. Mr. V. spent a number of his best years at the great horticultural establishment of Mr. Van Houtte at Ghent, Belgium, was recommended for his present position by Robert Craig of Philadelphia and right worthily does he fill it. E. G. Hill gave a talk on floriculture in Europe, as viewed in some of its commercial aspects. The question box was put to good use and evolved much that was of interest to a practical body of men such as were assembled.

The election of officers for the ensuing year resulted as follows: M. A. Hunt, Terre Haute, president; D. W. Cox, Crawfordsville, vice president, Mr. Huntington Indianapolis, treasurer; Wm. Berterman, secretary.

The committee to arrange for the next chrysanthemum show was appointed, and a most excellent list of premiums to be offered at that time, was agreed upon. The committee offer \$100 for the best undisseminated seedling chrysanthemum, five blooms to be shown on 14-in stems. This should bring out a good exhibit as it is considerably more than ever offered before in this country for a seedling.

On Wednesday night the society proceeded to the residence of Mr. Anthony Weigand where a most sumptuous repast was served to over fifty members. The generous hospitality so liberally dispensed by Mr. and Mrs. Weigand was supplied

mented by the graceful attention of the Misses Weigand. Everything was provided and done to render the evening a memorable one, and all went away with grateful hearts to Mr. and Mrs. Weigand.

The society has accomplished much good and has done valuable service in bringing the craft into a prominent place before the people of the Hoosier State. Its future usefulness, however, depends on the wisdom and judgment which shall prevail touching certain social questions which are uppermost. E. G. H.

Boston Notes.

Since the last report there has been a big tumble in prices of cut flowers and in the volume of business transacted. Just at present writing the weather is very cold and plenty of snow everywhere, so that the production is largely curtailed, but even under these circumstances there seems to be a complete stagnation. The only thing that never goes begging is a white carnation. These are all gobbled up as fast as they appear. All eyes are now turned toward Easter, and it is to be hoped that a big Easter trade will be developed to offset in part the present quietness.

The many friends of Mr. Frank Becker will be sorry to know that he has been seriously ill. Happily he is now convalescent and is considered to be out of danger. He is too good a man to lose.

James Conley has been cutting a large number of fine blooms from his new "Oakmont" rose. The color is very brilliant in this rose and holds well.

David Allan's dendrobiums are well worth seeing just now. As a dendrobium grower David has few equals, and his collection comprises many valuable species and very rare varieties.

On Saturday, March 1, Jackson Dawson exhibited at Horticultural Hall a box of *Cypripedium acule* in bloom, which was something remarkable. The box was only about 15 inches square and there were 47 perfect flowers. The color of the blooms was considerably deeper than is common with those that have grown outside naturally.

Mr. J. H. Cox and Mr. H. A. Bunyard, representing V. H. Hallowell, Son & Co., and The United States Nurseries respectively, have been canvassing Boston and vicinity thoroughly for several weeks. They are both indefatigable workers, and moreover have made themselves solid with the boys, and by the time they have got through with the Hub there will be nothing but gleanings left for anybody else.

Last spring while riding over a back-board road in the Maine Mountains I found a nice plant of *Cypripedium acule* alba in flower. As it was an unusually fine variety I dug it up with my jack-knife and kept it wrapped in a newspaper until my return home four or five days later. On exhibiting my prize to an experienced orchid grower he promptly informed me that I was a fool to expect a *Cypripedium acule* transplanted under such circumstances, and while in bloom, to live. Yet that same plant is now in flower at the Arboretum greenhouse and looks healthy enough. But they do say that with Dawson nothing is impossible.

The annual supper of the Gardeners' and Florists' Club will take place at the United States Hotel on the evening of April 10.

The subject for discussion at the March meeting of the club was "The Legal Rights and Liabilities of Florists Under the Laws of Massachusetts." A most entertaining and instructive talk was

given by Mr. R. T. Lombard, of Wayland, whose large experience as a lawyer before taking up the florist business enabled him to talk intelligently on this timely subject. He explained the laws applying to plants under various methods of culture, in open ground, in benches, beds or pots, showing the distinction between real estate and personal property, indicating what is attachable and what is not, what constitutes taxable property etc., and explained the laws governing the assignment of wages and the transfer of property of various kinds, giving special attention to those bearing on commission sales and sales at auction. The laws governing contracts of all sorts, including the relations between employer and employee, the limitations of co-partnerships and many other interesting points were covered by the speaker, who seemed to have the happy faculty of expressing himself in plain everyday English, avoiding technical terms and unintelligible legal phrases. The lecture was listened to with unusual attention and was certainly one of the best ever presented before the club.

A letter was read at this meeting from the family of the late Peter Henderson, thanking the club for resolutions of sympathy previously extended. W. J. S.

Washington.

The decorations at the dinner given Feb. 25 by Mr. and Mrs. Carnegie of Pittsburg, to the delegates and officers of the International Conference, with the President and his Cabinet were unusually elegant and elaborate.

The side walls were almost completely hidden from view by plaques of palmetto leaves, intertwined with wild smilax from the Carolinas. The north wall back of where President Harrison and Mr. Carnegie sat, was a gem from the florist's hands. The temporary mirror mantle, with the American flag falling in graceful folds over each side, was almost buried in banks of maiden hair fern, studded with clusters of hybrid roses and lilies, and beneath it were banked palms and blooming azaleas. In the corresponding corners were tall palms with specimen azaleas peeping from out the center, while the entire length of that side of the room was filled out with potted plants. The front of the corner clusters were handsome standing lamps with rare silk covers and lace edging. At the south end of the room the windows were dressed with rich curtains and lambrequins. Between them stood a secretary beautifully decked off with maiden hair ferns and azaleas. The corner by the end window was filled out with a bank of palms finished similar to those previously described. Opposite was the piano, where the musicians held forth, and which was dressed with palms and a standing lamp, while near the door was a dressing of smilax and palmetto leaves. The table was what is termed the round table, enlarged to accommodate forty-nine covers, and was 89 feet 8 inches in circumference. The top in floral design represented a mammoth four-leaf clover, a picture of beauty bringing forth expressions of the greatest admiration from those fortunate to see it in all its loveliness. The manner in which the design was brought out was so ingenious as to make the deception complete. In order to produce this effect the middle of the table had been removed to furnish the necessary space. In this space were 650 pots of ferns, all lowered some six inches below the table, resting on a temporary platform, leaving only

the luxuriant foliage visible. The stem of the clover leaf, made of lycopodium, ran from the center to the outer edge of the leaf on one side. The clover itself was composed entirely of maiden hair fern, rising about six inches above the level of the table, but not high enough to obstruct the view from any quarter. In the center of each leaflet were large mounds of Ulrich Brunner, Gabriel Luizet and Magna Charta roses. The leaflets were joined in the center of the table by a large cluster of Magna Charta roses. The base of these mounds of hybrid roses was encircled by lilies of the valley.

This four-leaf clover was bordered by rare and choice exotics representing in colors white and gold the fashionable ones of the season. Nestling between the leaves stood white and yellow tulips. Bordering on the tulips was a broad band of plush, fine in texture and finish, and giving the whole the appearance of a beautiful picture set in a rich gold frame. This was sprayed over with delicate fern fronds, causing it to resemble a superior embossed finish. At the outer edge of the plush the floral decorations were continued in a series of artistic garlands of ivy leaves, encircling the entire table. In the center of each garland was a cluster of large Ulrich Brunner roses and heather, and tapered to the edge with lilies of the valley. The damask surrounding the dishes was sprayed with fern leaves and heather, in deference to the host. Small & Sons of this city were the decorators. Z.

Siebrecht & Wadley's Orchid Show, New York.

An orchid show in the middle of February is considerable of an undertaking, for the weather may be peculiar and the temperature as near zero as 40°, but on this occasion the weather was propitious, the orchids numerous and lovely, and the patronage encouraging.

The orchids were arranged on side and end tables, and central ones so disposed as to set off the blossoms themselves to the best advantage, also to give to the hall the finest decorative effect, and at the same time afford abundant and easy room for visitors to pass hither and thither, and have a close inspection of all the flowers. Abundant use of ferns, asparagus, selaginellas, palms and cycads, gave a cheerful freshness to the show, and nesting to the cut flowers, and so free a use of greenery rendered unobjectionable the uncouth forms of many gorgeous orchid plants.

Most seasonable orchids were represented, and taking it all together there was a very large display of flowers, cattleyas, of course, prevailing, and of these Trianae was in the great majority, and next came *Percivaliana*. Mr. DeForest's large specimen of the white Triana that was here a year ago was again on exhibition and finer than ever. *Dendrobium* and *oncidium* were suspended here and there, *odontoglossum* graced many a nook, *ecologyes* were plentiful, *cymbidium* displayed their arching wreaths, *burlingtonias* diffused their delicious fragrance, *lycastes* held up their waxy heads, and gave a contrasting tinge of orange scarlet to the green, and the lovely *phalenopsis* nodded over the banks of other plants. The display of *cypripedium* was more confined to cut flowers than to plants, and consisted of several of the newer forms. But there was less variety than in previous years.

While the great majority of the orchids present were furnished directly from the Rosehill Nurseries, several private gar-

EUCHARIS AMAZONICA

dens and commercial establishments contributed freely to the exhibition. Each of these extra exhibits was arranged on a table by itself and full credit given. George Savage sent a generous collection of cut flowers from Mr. Kimball's greenhouses at Rochester. Mr. Everman sent from Easton, Pa., and Mrs. F. Goodrich from New York. Mr. F. Man, Weehawken, N. J., Mr. DeForest, Summit, N. J., and Mr. I. Posterman, Newtown, L. I., were the chief contributors in the florist class.

Of course, in so great an undertaking as is an exhibition of this size, it cannot reasonably be expected that so very many orchid flowers can be furnished at one time by the Roschill Nurseries, so a good many had to be bought from private parties, in which instance no public credit was given.

A bank of Empress of India amaryllises in gorgeous bloom was a gay attraction. These long neglected flowers are beginning to get a hold upon fashionable people.

A roomy glass case in a corner and filled with sonorillas, bertolonias and such like companionable gems drew many admiring eyes.

The large decorated archways were

covered over with evergreen wild smilax from the South, and Japanese honeysuckle vines, which this season have continued evergreen.

W. F.

Eucharis Amazonica.

A plant so generally popular—and deservedly so—as *Eucharis amazonica*, receives always great attention from the gardener, and any methods of culture which may have resulted in an abundance of large blossoms and healthy foliage are eagerly sought after.

The plant figured is, as will be seen, an example of first-class cultivation, and an object of beauty which any gardener might point to with pardonable pride. We will let our correspondent, Mr. W. Dean, of Solihull, Birmingham, who kindly sent the photograph in November last year, describe this plant and its culture in his own words:

"One of the finest specimens of this plant we have yet seen has recently flowered at The Henburys, Mosley, Birmingham, the residence of G. F. Lyndon, Esq. *Eucharis* are well grown here, one plant especially deserving notice, because of its size, its perfect health, and color and size of the foliage, and abundance of fine

flowers. This plant is in an 18-inch pot, and about six years old, and has had four repottings in the last four years. It is 4½ feet high, 5 feet through, and had 36 flower stems, with quite 220 blooms on them, the flowers large, and the foliage in the best of health. Mr. John Black, the gardener, uses a soil composed of good loam, a little leaf soil, some broken sandstone, and a few half-inch bones, with plenty (quite six inches) of drainage to allow water to escape freely. He finds that the roots adhere to the sandstone, and evidently derive benefit therefrom. The plants are kept through the winter and spring in a temperature of from 60° to 65°, but when blooming they are removed to a cooler house, but if kept too long, then the foliage suffers and decays. Watering is an essential point with Mr. Black. He uses very little directly on the soil, and then only in hot weather, and manure-water, and resorts to frequent syringings into the foliage, always with clean manure-water, using this freely in the growing season, but he never allows the plants to dry off. Too much soil in the pots and too much water at the roots Mr. Black holds to be injurious, and he trusts more to the copious syringings of the plant with weak manure-water. Some diseased bulbs of *encharis* sent to the Henburys some time since were washed and placed in a pan of sand with sphagnum at the bottom, where they grew freely, and were soon restored to health.

—*Gardeners' Chronicle*.

Cost of Production.

There has been considerable agitation of this question in almost every issue of the *FLORIST* and very few of the estimates seem to be anywhere near alike. Now we propose to give our method of finding the result, without which there would be likely to be some misunderstanding.

Pansies we grow in what is called the raised bed method, viz.: without frames. From an ounce of seed we obtained 2,120 plants, or leaving 120 for poor plants, 2,000, and the following is what it cost us to produce them: 1 ounce seed \$5; fertilizer \$1.50; labor \$12; use of land, water and interest for eight months at 6%, \$1.50. Total, \$19.

Therefore it cost us almost one cent each for our plants. Adding the cost of baskets for marketing, \$5.85, the whole cost is \$24.85, or about 1¼ cents per plant.

Asters we start in frames and market in flats. Using the same method of obtaining the cost, the result is \$15 for 2,000 plants, or ¾ of a cent apiece.

Tomatoes, cabbage and celery are all started the same as asters, and they cost us to produce, for tomatoes \$5 per 1000, or ½ cent apiece; for cabbage \$3 per 1000, and celery \$2.50 per 1000. We do not winter over cabbage, if we did there would be added the cost of wintering over. You may perhaps think that we have figured pretty fine, but in these times of sharp competition and rather uncertain markets it has to be done, and the cost has to be forced to the lowest possible limit.

For greenhouse or bedding plants the same methods of figuring can be used, adding the cost of fuel, pots, potting soil, etc. In carrying on this business you will find that you will need to use your brains as much, if not more, than your hands, and that the man who uses his brains the most, other things being equal, will be the one that will be the most successful.

ALFRED B. COPELAND,
Springfield, Mass.

Langwater Gardens.

Among the happy memories of the Executive Committee of the S. A. F. when in Boston in January was a visit to Langwater Gardens, the country home of Mr. F. L. Ames, at North Easton. This is a delightful and busy New England village on the Old Colony Railroad and about 22 miles from Boston.

Immediately on leaving the station we enter the Ames' domain and pass by the residence of ex-Governor Oliver Ames, and a quarter of a mile farther on cross the Langwater lake, an islanded and highly ornamented stretch of water, into the park-like gardens of Mr. F. L. Ames, who is the cousin of the ex-governor. And here we were met by Mr. William Robinson, Mr. Ames' vigorous and enthusiastic gardener who, as our time was limited, conducted us directly to the greenhouses.

This is an immense establishment gotten up in the most substantial and serviceable manner, and each house had been designed and built specially and in the most approved manner for the particular kind of plants to be grown in it, and all of the greenhouses except some small pits and a conservatory are in one block.

Prior to three years ago hot water alone was used for heating the greenhouses, but then some new greenhouses were built and steam heating introduced, and Mr. Robinson speaks boldly in favor of steam. And he completely dispels the common idea that the heat from steam pipes is injurious to greenhouse plants requiring a cool temperature and moist atmosphere, for odontoglossums and masdevallias are extreme cases in this direction and here they are growing in hundreds in steam heated houses, and with the luxuriance of fattened weeds.

The orchids are now the great glory of these gardens, and the collection is the choicest in America. Every plant is a specimen, and many of them are of massive proportions. They were then in gorgeous splendor. The display of cattleyas was splendid, some flowers were eight inches and many seven inches across, of full and perfect form, glistening substance and delicate and richly tinted hues. The *lælias* were also in floral perfection. And particularly noticeable among the *Lælia anceps* was the absence of the commoner types and the prevailing abundance of the finer varieties as *Dawsoni*, *Williamsii*, *alba* and *Shroederiana*. *Cypripediums*, *oncidiiums*, *dendrobiums*, *phalenopsis*, and many other genera displayed their lovely flowers and there was an air of luxuriance, cleanliness and profusion about all of the plants that was very gratifying.

The collection includes about 8,000 plants in 1,300 species and positive varieties. Of course varieties might be greatly extended, for instance, among their 200 plants of *Cattleya Trianae* at least 50 distinct varieties might be defined, but such multiplicity is discouraged and no variety not recognized by the Royal Hort. Society of London or other high authority is acknowledged here as distinct. And I have no doubt whatever that Mr. Ames' cattleya house contains the most valuable

collection of plants of any kind in any greenhouse in America. This house is 100 feet long by 20 feet wide, and at a moderate estimate contains \$100,000 worth of plants.

In addition to this cattleya house there is one odontoglossum house 100 feet long by 9 feet wide, and another 90 feet long by 9 feet wide; an East Indian house 35 feet long by 18 feet wide, and a Mexican house also 35 feet long by 18 feet wide.

But this is not all. Among the other greenhouses the grotto is particularly attractive. It is a rustic fernery under glass, 40 feet wide each way, and laid out in a rocky-appearing natural style, with steep and rugged, fern-clad declivities, embouldered surfaces and irregular stepping stone paths. A would-be mountain stream dashes down over the rocky precipice into a little lake below, bespattering in its noisy course the mosses and the filmy ferns that find congenial quarters in such a drenching home. And the whole grotto is verdant with creeping and depending ferns and mosses that spread over and among the rocks and drape the cliffs. And high over all is spread the tree fern's broad expanded head.

From a roomy conservatory devoted to seasonal plants in bloom we passed into the tropical fine-foliage plant house, a building 70 feet long by 30 feet wide and here beheld some extremely fine examples of cultural skill. Just think of *Anthurium Veitchii* 8 feet in diameter with dozens of leaves, the perpendicular blades of many of which were five feet long. And *Nepenthes* in tropical perfection and profusion were suspended from the roof. Prominent among them were *Crissis albo-marginata*, many of the finer hybrids and species, and the famous *Rajah* in splendid condition. The white *Ipomæa Thomsoni* was in bloom and running along under the roof and over the pathway. And ferns seemed to luxuriate in this building. *Lomaria gibba* platyptera had a head as broad and full as a large *Cycas circinalis*; *Microlepia hirta cristata* had tasselled fronds over five feet long, and *Gymnogramme schizophylla* in a pot raised above the bench displayed the marvelous beauty of its exquisitely cut fronds in a solid hemispherical specimen four feet across.

In so hurried a visit I was unable to do more than note a few of the more striking orchids, and to these I must now restrict my remarks. Before sending them to you, however, I submitted the descriptive matter to Mr. Robinson, who kindly revised and corrected it.

CYPRIPIEDUM MASTERSIANUM in an 8-inch pot was throwing up a flower stem. A little plant to be sure, but small as it is, a few weeks ago a New Jersey firm offered \$500 for it. It is an extremely rare species from the East Indian Islands. The foliage is deep green tessellated with pale green and the flowers are large and distinct from any others of its class.

CYPRIPIEDUM LEEANUM SUPERBUM.—A handsome plant in a 12-inch pan was bearing eight flowers. It is a superior form of the fine hybrid obtained from C. *Spicerianum* X C. *insigne* Maulei and which was the first hybrid got from *Spicerianum*.

CYPRIPIEDUM SITENS.—A specimen in a 12-inch pan was bearing six flowers. It is a hybrid between C. *villosum* and C. *insigne* Maulei, and in it the beauties of both parents are nicely blended; its dorsal sepal, in the way of C. *i. Maulei* but larger and whiter, is conspicuously bright.

CYPRIPIEDUM SCHRODERÆ was in good

bloom. It is one of Seden's hybrids between C. *caudatum* and C. *Sedeni*, and has branching stems and large, showy reddish flowers.

CYPRIPIEDUM MORGANÆ was represented by a splendid specimen in a 14-inch pan. It was not then in bloom, but I had seen this same plant in flower in summer, a year ago. It is a Veitchian hybrid raised by Seden between C. *superbiens* and C. *Stonci*, and named by them in compliment to the late Mrs. Morgan, of Madison Square, New York, who at that time had one of the finest collections of orchids in this country. Her orchids were said to have cost her \$200,000; after her decease, nearly five years ago, they were sold at auction in New York for little more than a tenth of this amount. In 1881 Veitch presented one of these *cypripediums* to Mrs. Morgan; it was then valued at \$2,000; and at the auction sale of her plants Veitch bought it back again for \$750. Mr. Ames bought his plant from Veitch in '85, paying \$300 for one "lead." There is a figure of this fine orchid in the *FLORIST*, Vol. II, page 163.

CYPRIPIEDUM AMESIANUM.—A vigorous and handsome plant was bearing five flowers. This is a new orchid, a hybrid raised in England between C. *villosum* and C. *venustum* and named in compliment to Mr. Ames. But what a pity! So generous and enthusiastic an orchidist deserves a far richer compliment than this ordinary-appearing garden hybrid. Some authorities class it as a variety of C. *Measuresianum*; both are children of the same parents.

CYPRIPIEDUM LEUCORRHODUM.—An excellent plant in a 12-inch pan. It is a Veitchian hybrid between C. *longifolium* Hartwegi X C. *Schlimi* albiflorum, and is the most beautiful hybrid of the *Selenipedium* group of this genus.

CYPRIPIEDUM HYEANUM was represented by a little plant in a 3-inch pot, and we were informed that it is worth 75 guineas (over \$375) a "lead." It was introduced by Hugh Low of London, from Borneo whence it was imported among a lot of C. *Lawrenceanum*, and in the summer of '88 only two small plants of it were in cultivation in Europe. It is called the albino form of C. *Lawrenceanum*.

CYPRIPIEDUM ORPHANUM is a little orphan in the hybrid family, rare and valuable, and here represented by a very thrifty specimen. Mr. R. writes: "So named because of its doubtful parentage. A Veitchian hybrid between *barbatum* or allied species and *Durii*."

CYPRIPIEDUM CHINTINI, PHILBRICK'S VAR.—This is one of the finest forms of C. *insigne*. It was bearing four flowers. The broad white margin extends half way down the upper sepal, and the spots on the white area are of a beautiful mauve purple. The pouch is yellowish brown and very broad.

CYPRIPIEDUM YEXILIARIUM SUPERBUM had four flowers. The plain vexillarium was the first hybrid where the modest C. *Fairieanum* was the parent, it was raised by Dominy and first flowered in 1870. The superb variety has larger and more richly colored flowers than those of the typical plant.

CYPRIPIEDUM HARRISIANUM SUPERBUM was seen in a beautiful plant in a 14-inch pan. Than those of the type the flowers of this variety are larger and have a more glossy surface and all the segments are more richly colored.

CYPRIPIEDUM ARTHURIANUM.—This is Mr. Robinson's pet of the genus. He

writes: "How well do I remember seeing this modest yet aristocratic looking hybrid in bloom in 1873 at Veitch's, London. It was raised, the second lot of the Faircannum seedlings, and only one plant was the result. Mr. Hugh Low had to come from London to our establishment here to see the first bloom of *Arthurianum* that he had ever seen; this was five years ago, and it was the first flower of the kind produced in America. I see some are claiming another variety, namely *pallidum*, but up to the present time all plants have been raised from the one seedling."

CATTLEYA BRYMERIANA from Brazil and supposed to be a natural hybrid between *C. superba* and *C. Eldorado*, though not in flower, attracted our attention because of its rarity and value. One of these plants cost \$625.

CATTLEYA TRIANÆ DAYANA was in superb bloom. The flowers were over 7 inches across and the petals $2\frac{1}{2}$ inches wide; sepals and petals bright lilac rose, lip margined with rose and blotched with rich magenta-purple and marked with orange in the throat. The prettiest of the *Trianæ*s.

CATTLEYA TRIANÆ VAR. LEEANA.—This is the largest flowered of the *Trianæ* group; its blossoms were $8\frac{1}{2}$ inches across. Sepals and petals delicate rosy mauve, anterior lobe of lip crimson-purple and extending into the throat and almost obliterating the characteristic yellow disc. This particular plant has four "leads" and is growing in a 10-inch pot. It was bought in at auction in London a couple of years ago for 180 guineas (over \$900).

CATTLEYA WARCEWICZII ALBA, or the white *C. gigas* as we generally say. This is the plant that Mr. Ames bought of Siebrecht & Wadley, New York, a couple of years ago for \$1,000, and which was so much written about at the time. It is the only plant of the kind known, and it is a fine healthy specimen carrying seven active leads. Sepals and petals are pure white and large, and the lip is slightly tinged with pale lilac, and the disc pale yellow.

CATTLEYA SKINNERII ALBA in a 10-inch basket was said to be worth \$375. It was not in bloom. And near by were some enormous masses of the true *Skinneri*; one densely filled raft basket that we measured was 24 inches wide by 45 inches long; it was the largest mass of the kind I had ever before seen.

CATTLEYA CHOCHOENSIS.—Several lovely forms of this fragrant, campanulate species were beautifully gay.

CATTLEYA PERCIVALIANA GRANDIFLORA.—A splendid specimen in a 16-inch pot had 13 extremely large wide open perfect flowers with intense rich crimson-blotched, yellow marked lip.

CATTLEYA TRIOPHTHALMA, a Veitchian hybrid between *C. superba* X *Lælia Exoniensis*, was growing in a 6-inch pot, it had eight bulbs and two spikes bearing four and five flowers respectively. The blossoms are about 5 inches across. "Sepals and petals pale rosy purple; side lobes of lip white, streaked obliquely with purple, middle lobe rich amethyst purple with a narrow white margin and yellow disc crossed transversely by a purple streak." It is a beautiful and distinct hybrid, and only two plants of it were raised, and of these one is now in the collection of Baron Schroder in England, and the other is the specimen referred to above in Mr. Ames' collection.

CATTLEYA REINECKIANA.—This was not

in bloom at the time of our visit but a large specimen in a 12-inch basket demands a word for it is worth \$1,000. It is a splendid orchid, probably a form of *C. Mossiae*, and is said to have originated in the garden of Mr. J. Sichel, Cheshire, England. Mr. Robinson told us the above plant bears flowers over 8 inches across; sepals and petals pure white; lip broad and frilled, violet purple with yellow throat veined with purple. In the market it is worth \$150 a "lead." Among the *Mossiae* group we also noticed a splendid mass of *Wagneri* filling a 20-inch square basket, *C. M. alba* and *M. aurea*, *afantiaca*, *Dodsoni*, *Arnoldiana* and *Massangana*. This is a unique variety and worth \$375 a lead; it is one of the deepest colored *Mossiae*s and the sepals and petals are marbled.

LÆLIA FLAMMEA.—Our attention was directed to a little plant of this costly gem; it had eight pseudo-bulbs and two "leads," and we were informed that it was worth about \$500 a break. It is a garden hybrid between *C. cinnabarina* and *L. Pitcheriana*, and Mr. R. says it is "the most striking and distinct hybrid *lælia* yet raised as regards the color of its flowers and which is unique even among orchids."

LÆLIA BELLA, of this we also saw a very fine plant. It is a rare and valuable Veitchian hybrid obtained from *L. purpurata* X *Cattleya labiata*. Mr. R. describes the flowers: "Sepals pale rose purple suffused with white, petals undulated and more deeply colored, lobes of lip amethyst purple with deep veins externally, intermediate lobe rich purple. A grand hybrid."

LÆLIA ANCEPS VARS.—These were in gorgeous array. But a noticeable thing about them was the conspicuous fewness of the ordinary typical form and the abundance of the superior varieties. The pure white—*anceps alba*—shows the faintest touch of greenish yellow in the throat; *Dawsoni* has larger sepals and petals also pure white, and colored lip; *Sanderiana*, just like *Dawsoni* in color but reduced in form and size; *Williamsii*, large flowered, all the segments white except the usual yellow disc and radiating purple lines on the inner side of lobes; in *Percivaliana* the sepals and petals are pale rose-purple suffused with white, and in *Protherocana*, *Winniana* and *Scottiana* we have the darkest colored flowers of *anceps*, and all superb. In *Lælia anceps Amesiana* we have the same perfect form of blossom that we find in *Dawsoni*, but distinguished by a deep blotch of crimson purple on the petals. There are only three plants of it known and they are valued at \$375 a "lead."

ZYGOCOLAX VEITCHII is the most unique plant in the collection, for it is the only plant of the kind in the world. It is one of Seden's bi-generic hybrids, its parents being *Zygopetalum crinitum* X *Colax jugosus*. It is represented by a thrifty plant in an 8-inch pot and which is throwing four flower spikes. The plant itself looks like a very strong growing form of *Colax jugosus*, and the flowers have an appearance intermediate between those of the parents.

SOPHRO-CATTLEYA BATEMANNIANA VAR. ROSEA.—Passing through the cattleya house we came upon this priceless little gem. It is another of Seden's bi-generic hybrid orchids, and without doubt the most remarkable hybrid orchid ever raised. It was obtained from *Sophrontes grandiflora* X *Cattleya intermedia*. The seed from which it was raised was sown in June 1881, and from it several

seedlings were secured, and the first flower expanded in August 1886. In the very few plants that have bloomed since then there is a slight variation of color in the flowers, the scarlet of the *sophrontes* being more apparent in some than in others. In general "the flowers are three inches across; sepals broadly lanceolate; petals broader, ovate, oblong; both sepals and petals bright rose color toned with scarlet; lip very distinctly 3-lobed and on the inner side cream white bordered with amethyst-purple." This *rosea* variety is the jewel of the precious family.

VANDA AMESIANA.—Some fine specimens were in full bloom in the cattleya house. It is a new species recently introduced from the East Indian Islands by Low, of London, and named in compliment to Mr. Ames. It is a moderately short growing plant with thick narrow leaves, and judging by its behavior here and the accounts we have of it from European gardens, it must be a most copious blooming species; these plants were bearing many long stiff spikes of very fragrant white blossoms with a rosy-tinted lip.

DENDROBIUM BROOMFIELDII.—An Australian species bearing very beautiful and richly colored flowers. It is suggestive of an intermediate form between *D. bigibbum* and *D. Phalenopsis*.

DENDROBIUM EUOSMUM LEUCOPTERUM.—We noticed a thrifty specimen of five pseudo-bulbs of this extremely rare and valuable plant. It is a hybrid raised by Seden between *D. endocharis* and *D. nobile*. And out of the same seed pod were raised two other hybrids, namely, *D. euosmum* and *D. e. var. roseum*. It was awarded a first class certificate by the Royal Hort. Society of London April 9, 1889.

DENDROBIUM LEECHANUM suspended from the roof of the cattleya house (where it was brought while in bloom) was flowering profusely. It is a handsome hybrid raised in England between *D. aureum* and *D. nobile*; the flowers were white, tipped with rich deep rose-purple.

CALANTHE PORPHYREA was in good bloom. It is a winter-blooming orchid bearing brilliant, rich purple flowers. A garden hybrid between *Limnæodes labrosa* and the red-eyed *Calanthe vestita*.

LYCASTE PLANA VAR. MEASURESIANA showed a decided improvement over the typical form. It is a desirable and free winter-blooming orchid; its flowers are large, showy, white and freely colored with carmine markings.

SACCOLABIUM HEATHII is the white flowered form of *S. Blumei*, and extremely rare and valuable, for there are only two plants of it known in cultivation and Mr. Ames has one of them, a fine half specimen.

ONCIDIUM SPLENDIDUM, a vigorous and handsome species from Central America, was in fine bloom. Its flowers are large, sepals and petals greenish yellow barred with brown, and the lip very large and of a clear yellow color.

ONCIDIUM OBRIZATUM was a sheaf of flower spikes. This, although neither a new nor rare species, is one of the most profuse blooming and delightfully fragrant of all orchids.

ODONTOGLOSSUM ELEGANS was showing a strong flower spike. It is a supposed natural hybrid between *O. cirrhosum* and *O. cristatum*; its flowers are yellowish white marked with dark chocolate spots and blotches.

CYMBIDIUM EUBURNÆUM.—A massive plant in an 18-inch pot was bearing about 60 flower spikes. The large ivory white flowers rising above the deep green grace-

ful foliage had a fine effect. This specimen is worth about \$300.

CELOGYNE CRISTATA VARS.—These were in the heyday of their glory. There was a splendid specimen of *C. cristata alba* with about thirty "leads." Other forms of *cristata* comprise *Leoniana*, *maxima* and the *Chatsworth* variety. Among other species of *celogyne* we noticed the precious *C. Dayana*, a handsome plant with eight "leads," and I believe the best specimen of its kind in cultivation. Six years ago it was priced at \$100 a "lead," and now this vigorous specimen must be worth about \$500. Other species included *C. Sanderiana*, *Fostermannii*, *Cunningii*, *pandurata*, *Schilleriana*, etc.

EPIDENDRUM O'BRIENIANUM.—Although this orchid was not in bloom, on account of its rarity and fame we were much pleased to look upon a vigorous plant of it. It is a garden hybrid obtained by Seden from *E. vectum* X *E. radicans*, and is the first seedling *epidendrum* ever raised artificially. It was awarded a first class certificate by the Royal Hort. Society, London, May 22, 1888, and a Certificate of Merit by the Royal Botanic Society, London, June 20 of the same year.

EPIDENDRUM VECTUM was in bloom, it always is. It has tall leafy stems at the ends of which it bears many-flowered racemes of deep magenta-purple flowers. In the same way, but finer, is *E. radicans*; it has bright scarlet flowers with orange marking on the lip. Other fine species are *E. cinnabarinum* with terminal corymbose cymes of scarlet flowers and *E. xanthinum* with yellow blossoms. They deserve to be grown and are of easy culture standing shoulder to shoulder, but well up to the light in an airy house with plenty of moisture.

SOIRALIA XANTHOLEUCA.—We noticed a most luxuriant specimen in an 18-inch pot, no doubt the finest plant in cultivation, and worth every penny of \$800. It has yellow flowers with a white throat, and *S. leucoxantha*, a new and rare species, has white flowers with yellow throat. And we also came upon *S. Kienastiana*, the white-flowering *marantha*, and an extremely rare and valuable sort. Mr. Ames' plant of it has about nine "leads;" he bought it when it was about only half as large as it now is for \$250.

NAMING a desirable new species or variety of plant in honor of some person is a pretty compliment to pay to any one, and the more beautiful and valuable the plant the handsomer the compliment. And this is a frequent occurrence as regards roses, *chrysanthemums* and florist's flowers where the plants have little more value than a dollar each; but in the case of orchids where the individual is worth maybe \$500 or \$1,000, or when it comes to a unique plant, when the specimen is priceless, what a splendid compliment it is. And Mr. Ames has been more honored in this way than has been any other American. Among the most important orchids named in compliment to him are the following:

PHALANOPSIS FREDERICK L. AMES.—A *Veitchian* hybrid obtained from *P. intermedia* Portei X *P. amabilis*. It partakes largely after *P. intermedia* Portei, but is entirely distinct. Only one plant in existence and it is in Mr. Ames' collection, and priceless.

LÆLIA AMESIANA.—One of *Veitch's* hybrids, and too one of the most beautiful they have yet obtained. Its parents are *Lælia crispata* X *Cattleya maxima*. Mr. Ames has two fine plants which, probably, are worth \$1,000.

ODONTOGLOSSUM ROSSI AMESIANA.—A very distinct variety introduced by Williams. Than those of the type its flowers are larger in all their parts, and the sepals extend over half the petals and are very highly colored on the margin.

VANDA AMESIANA.—Introduced by Low and no doubt one of the finest and most fragrant and copious of winter-blooming orchids.

LÆLIA ANCEPT AMESIANA.—One of Sanders' introductions. Worth \$350 a lead. Imagine a large perfect flower of *L. a. Dawsonii* and then imagine a large crimson-purple blotch on each petal and a deep crimson lip, and you will have a fair idea of this splendid orchid.

CATTLEYA HARDYANA AMESIANA.—An introduction of Sanders'. *Cattleya Hardyana* is a supposed natural hybrid between *C. Dowiana* X *C. Warszewiczii* and a very scarce orchid in cultivation, but within the last 18 months several have turned up among importations of *C. Dowiana*. About two years ago Mr. Hardy, of England, and who was the first to flower it, offered his plant with two leads for sale for 450 guineas (over \$2,250), but I never heard of any purchaser. Now one can get a plant for 50 guineas. *C. Hardyana Amesiana* is the only plant of the variety, hence priceless.

WM. FALCONER.

A Double Cypripedium.

It happens very often that owing to various conditions, orchids, and especially cypripediums, will produce monstrous flowers, some having two lips, or two or three additional petals and sepals, or otherwise mal-formed; but I have before me the first instance of an orchid flower becoming really double. The plant in question is *Cypripedium Boxallii*, with three flowers on the plant. They have their normal form, size and everything with the exception that the stigma and the pollen masses have changed into numbers of petals and sepals, in the regular way as we see single roses, pinks, or anything else turning double. The same plant had the double flowers last year, and it may be interesting to watch whether year by year this plant will add more and more petals and sepals until we have as double a cypripedium as there is a double begonia or double dahlia. Unfortunately it takes so long to raise cypripediums from seed so as to experiment, and furthering this process by this means would take from four to ten years. I must admit that while the flower is double, the ordinary single forms are far prettier, unless being such an unusual novelty we are not used to it yet.

Short Hills, N. J. W. A. MANDA.

Kalanchoe Carneae.

This was a *Veitchian* novelty last year, and it occupies again, this season, a conspicuous place among novelties. It was figured and referred to in the *FLORIST* March 1st last year. Since that time however it has been grown and flowered abundantly throughout the country, and, in my opinion it is a failure. I don't believe it has come to stay among florists' flowers, although it will hold a place in private and botanical gardens. It is easily raised from seed, of the easiest possible cultivation, and it blooms copiously the first year from seed. Planted out in summer and lifted and potted in fall, in any kind of common soil, and given carnation or rose-house temperature it gets along admirably. The foliage is large, succulent and coarse and there is nothing

elegant about the get-up of the plant; the flowers are a delicate pink but far from pleasing or striking in color, and before all are full open some begin to wither off; but its great redeeming feature is its sweet perfume. I am very well aware that opinions differ regarding this plant: Wm. Robinson at North Easton, Mass., showed it to me the other day, and exclaimed, "Isn't that a grand thing?" Edwin Lonsdale, of Philadelphia, on the other hand, is disappointed with it. I send you a photograph of one of my plants in bloom, and which was raised from seed last spring, planted out in summer, lifted and potted in September, and blossomed in the carnation house in November and December.

WM. FALCONER.

[The photo showed a plant bearing some fifteen heads of bloom and a decidedly better specimen than the one figured last year.—Ed.]

Nomenclature.

S. A. F. Committee on Nomenclature.

JAMES D. RAYNOLDS, Riverside, Ill., Chairman.

Roses:

ROBERT CRAIG, 49th & Market Sts., Phila., Pa.
EDWIN LONSDALE, Chestnut Hill, Phila., Pa.
ERNEST ASSMUS, West Hoboken, N. J.

Carnations:

A. E. WHITTLE, Albany, N. Y.
JOHN THORPE, Pearl River, N. Y.
WM. FALCONER, Glen Cove, N. Y.

Palms, Ferns, and Glen Decorative Plants:

CHAS. D. BALL, Holmesburgh, Phila., Pa.
JOHN BURTON, Chestnut Hill, Phila., Pa.
W. R. SMITH, Botanic Garden, Washington, D. C.

Chrysanthemums:

JOHN THORPE, Pearl River, N. Y.
WM. FALCONER, Glen Cove, N. Y.
J. M. KELLER, Bay Ridge, N. Y.

Bedding Plants:

G. L. GRANT, 54 La Salle St., Chicago, Ill.
ROBERT CRAIG, 49th & Market Sts., Phila., Pa.
J. M. KELLER, Bay Ridge, N. Y.
A. E. WHITTLE, Albany, N. Y.

Orchids:

DAVID ALLAN, Mt. Auburn, Mass.
BENJ. GREY, Malden, Mass.
WM. FALCONER, Glen Cove, N. Y.
J. FORSTERMAN, Newtown, N. Y.

Help from the Experiment Stations.

The chairman of the nomenclature committee has received replies from a large number of the agricultural experiment stations to which was sent the circular letter recently published in the *FLORIST*.

With one or two exceptions, the tone of these replies is that of cordial approval. Many of the stations have but just begun operations and are as yet only equipped for farm work, so can only give us good wishes, but from no less than sixteen promise of substantial assistance has been received. Some of these have at present but limited facilities, and can undertake only such work as the testing of annuals and hardy plants, but seven of them have greenhouses and are ready to undertake the testing of almost any class of florists' plants.

Following is the list of state experiment stations that have promised co-operation: Alabama, Arkansas, Illinois, Iowa, Georgia, Mississippi, Maryland, Michigan, Nevada, New Hampshire, New York (at Cornell University), Massachusetts (Hatch Experiment Station), Ohio, Oregon, Pennsylvania, and West Virginia.

Professor Burrill and Assistant Horticulturist McClure, of Champaign, Ill., had long ago the opinion that some part of the Government appropriation ought properly to be devoted to the interests of floriculture. It will be remembered that Professor Burrill sent a communication to the Chicago convention to that effect, and he last year secured permission from

the board of direction of his station to undertake some work in the very line we are now proposing. Mr. McCluer notified two former officials of the S. A. F. to this effect, but for some unexplained reason his communications seem never to have been brought to the notice of the nomenclature committee.

Nearly two years ago the director of the Michigan station also expressed his willingness to undertake some work in the interests of floriculture, if the S. A. F. would only indicate what work it wanted done, and this was brought to the notice of the society by the present writer at the New York convention, but no one seemed to have any work to suggest and the proposition fell cold.

Now, however, we have a work of unquestioned importance, and one which the experiment stations may with propriety take up and are ready to take up. If we do our part, they will certainly do theirs, and it will be our own fault if important results are not accomplished in the near future. J. D. R.

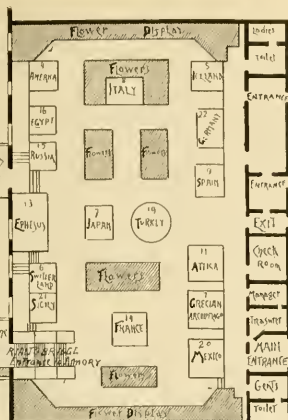

Chrysanthemum "Ostrich Plume."

The names "Ostrich Plume" and "Mrs. Alphens Hardy" have been given to the same chrysanthemum in one of the spring catalogues, "Ostrich Plume" in large type and "Mrs. Alphens Hardy" in small type, and my customers are calling for the "Ostrich Plume" chrysanthemum. I sell them the Mrs. Alphens Hardy and tell them it is the same thing but it takes an awful amount of explanation to convince them and it is very annoying. What use is there of adding another name to a plant which already has one and thus cause needless confusion and trouble? Little Rock, Ark. W. W. HERRON.

[This is rather a knotty problem. It seems unwise to multiply names, and still we can hardly object to catchy, popular names when the correct name is also given. The brisk demand our correspondent has had for the "Ostrich Plume" over the Mrs. Alphens Hardy, would indicate that the catchy name sells the plant more rapidly, and that he is getting some of the benefit of the cataloguer's advertising. If it takes a name of this kind to popularize a plant, and get the public to buy a good thing, we presume we shall have to indulge the public, only insisting that the correct name be always given with the other.—Ed.]

Detroit Exhibition.

We present herewith a floor plan of the arrangements for the coming floral and musical festival at Detroit. The booths are to represent the architecture of the countries designated and will be presided over by ladies attired in the costume of that country. Each one of the city charities has a booth and has selected some one flower which it will have on sale,

The competitive displays of plants and flowers will be interspersed as shown for which over \$1700 are offered in premiums. The exhibition will be open four days—April 22-25, and is under the direction of Mr. W. H. Brearley, proprietor of the *Detroit Journal*. The net proceeds will be divided between the twenty-three Detroit charities, the managers of which will of course use all their influence to make the festival a success.

American Horticultural Society.

The ninth regular meeting of the above society was held in the hall of the House of Representatives at Austin, Texas, from February 17 to 21. Although not strictly germane to a florists' publication, we are all so interwoven that a few words of its proceedings may not be out of place. The A. H. S. is an outgrowth of the old Mississippi Valley Horticultural Society, holding its conventions biennially so as not to clash, and to alternate with the American Pomological Society. Two years ago this society took in California, and it proved one of the most wonderful jaunts that has ever been undertaken by members of the craft. This year Texas was selected as a new and untried field, and none but those who have traveled over this wonderful state has any idea of its boundless possibilities. One may read and read, but it conveys no adequate idea of this one state of this great country.

As by far the most of the meeting was taken up by other than floral work, I will not tire your patience by the different papers presented. Suffice it to say that fruits, trees and kindred interests were the rule; although a paper from the late Peter Henderson on the culture of the chrysanthemum, had been sent previous to his death, and was read together with an eulogium on his services to horticulture. A paper was also read on the now quiet subject of a national flower by Mrs. J. P. LaMonte, of Illinois, that took the ground that no one national flower should be selected, but that each state should select a flower, and for the nation at large, the whole should be combined into one vast nosegay or wreath. The American florists seem to have quit the national flower idea about as suddenly as it was sprung on us and so will.

After the meeting, as usual, came sight seeing, and the Texans vied with each other to take the crowd all over the state. The only points finally accepted as ad-

missible and bring the time within the possibilities, was first a run up to Marble Falls, where the granite was obtained for the great Capitol building. From thence to San Antonio, an old place with lots of buildings of the Jesuits, dating back to old Spanish times. Here, among numerous other native plants of wonder to the northern man the *Acacia lutea* was a mass of yellow blossoms, and as common as the willows of the north. From thence a trip to Rockport on the Aransas Bay, a vast expanse of water landlocked from the gulf and that is supposed to be capable of making the finest harbor in the south. Thence to Galveston, where the summer is perpetual and the oleander a weed with great bushes and hedges a mass of flowers. A train from this point fifteen miles back from the gulf and a grand strawberry festival was given on the open lawn, with the heat like a summer's day. Near this place, Hitchcock, is an old Freuchman, H. Perthuis, with a large rose garden, containing hundreds of kinds of roses, including all our ordinary greenhouse kinds, teas, monthlies, etc., in great bushes and a sea of flowers, like a veritable June rose garden. So far, as with us, they had had no cold weather and vegetation of all kinds was summerish in the extreme. But alack, what a part of the state at least showed 24 hours after we shudder to think of, as by that time we had run a 12 hour's trip to Lampasas Falls, and in 12 more to Demison, when the blizzard struck us, and with peaches, strawberries and similar things in full bloom, figs set with fruit and so forth, the thermometer showed 12° of frost and still falling. Such a storm is occasionally looked for in this locality early in January, but in a season like this at the end of February it means disaster, and is one of the things that make one satisfied with the ills one has and not be to hot to fly into those one knows not of.

Much is here as a matter of course crude in the way of gardening, but the time must come when at certain seasons of the year it will be a veritable paradise, even now the people simply pity the people of the north, and are contented and happy. A very good idea may be conveyed to the florist of the climate when told that near Galveston tuberoses were in full flower out of doors.

That the society is a strong one may be gathered from the secretary's report, giving a membership of 703 last year, from all the states except Montana and all the territories except Alaska, New Mexico and Indian Territory. The expense including a well gotten up report biennially, is maintained by the \$2 dues which entitles to the report.

The officers elected are: President, Parker Earle, Cobden, Ill.; Secretary, Prof. Papinow, Experimental Gardens, Manhattan, Kan.; Treasurer, J. C. Evans, Harlem, Mo. EDGAR SANDERS.

Cut Worms.

In my garden last summer I found that those "light colored" large worms about an inch in length were destroying the foliage on many of my tender-leaved plants. On the ground I discovered one full-grown worm, seemingly dead, and a large red ant was tugging at it, actually dragging it away. Exploring further, I saw an ant run briskly up a plant and pinch a large worm that was contentedly feeding on a juicy leaf. The worm dropped to the ground, and at least a dozen ants started for the wriggling worm. Each one gave him a pinch. The worm writhed and twisted, but its tormentors never relaxed

their hold on its tenderskin. After a very short time the worm was worn out, and died after its fierce struggle for liberty. In a few days after I saw the first ant in my flower bed I couldn't find a worm on my plants. It seemed so remarkable to me to see such a small insect attack an object so many times larger than itself that I thought it worth recording.

Prescott, Wash. Mrs. C. L. BOONE.

Promising Sorts.

ED. AM. FLORIST:—I send you a box of carnations, containing fourteen varieties, many of which I do not remember to have seen described in the *FLORIST*. And as every progressive florist in at least the United States does not fail to read your valuable paper I thought a description of some of the varieties with characteristics of growth, etc., would surely interest some of your readers.

Silver Spray, a comparatively new variety, has been often described and is pretty well known, but the half has not been told. It has three points of excellence which can not be too strongly dwelt upon; first, it comes early; second, after the first few pickings it can almost invariably be picked with stems from six to eighteen inches in length, and that without sacrificing buds or cuttings; third, rapidity of opening. Blossoms can be picked close and in a few hours can be gone over and picked again even in winter.

Silver Lake, though we do not consider as approaching Silver Spray, yet has many points of excellence. The flowers are of good size, deeply fringed and also produced on very long stems.

L. L. Lamborn—have picked the largest blooms from this variety that I have ever seen, without exception. Of the purest white, dwarf in habit and splendid for pot culture and low benches.

Jeanette, another white and exceedingly strong grower. Though late, can be developed in good season, and in freedom, purity of color and size of blossom is exceptionally fine.

Starlight, the most delicate shade of yellow that we know of in the market, and taken with the pure white varieties lately introduced makes a most dainty combination of colors. Very like its parent Hinze's White in habit, strength, etc.

Shellflower, although not one of the new varieties, its merits are not appreciated. It is a clear shade of pink, lighter than Tidal Wave or May Queen; flowers of good size and substance and produced freely.

Florists have been trying hard to find some variety of carnation that will give the beautiful shade of Grace Wilder without its defects. Among the contestants for this enviable place of honor we find Beauty of Oxford, the shade of Grace Wilder at its best, and as yet developing none of that variety's unfortunate tendency to come off color. Its disposition is to come late, but I think it can be brought in as early as Hinze's White.

Fair Rosamond, another rival of Grace Wilder, somewhat lighter in shade and of great promise.

Blizzard, ground creamy yellow, striped and variegated with scarlet, large, early and free; promising in its class.

Paxton, white striped with scarlet, very productive of large perfect blossoms.

Old Gold, a new variety of the color of which is fitly described by its name.

Geneva, good addition to the fancy varieties; white, mottled and edged with purple, dwarf in habit, early and free.

Delicata, a delicate creamy white, edged with light pink, very free and blooms produced on long stems.

J. J. Harrison, the largest, daintiest in color of any variegated carnation we have seen. Its beautiful white blossoms just outlined with pink make it a valuable addition to plain white for any class of designs and for cut flowers. We find it indispensable.

Grand Haven, Mich.

GEO. HANCOCK.

Carnation Growing.

We grow our carnations entirely in crops—that is we have four houses devoted to carnations—H. White—and they are all kept at different temperatures, varying from 40° to 60°; the house in which the highest temperature is maintained coming in first and the others following about four weeks apart at January 1. All the houses are then about blooming, say one house is going out, one just beginning and two in full crop. These four houses hold about 10,000 plants and each plant averages about 40 blooms. Each house is 120x18 and holds about 2,500 plants. We shall grow ten houses of carnations next year.

SCHILLER & MAILANDER.

Niles Center, Ill.

Cost of Production.

Regarding Mr. Chitty's notes in last issue on cost of producing carnation blooms, several queries have been received as to where the cost of the plants was provided for. This same point occurred to us when Mr. Chitty's article was received and we dropped him a line regarding it. He replied as follows: "The plants which produced the flowers referred to were, with one or two small exceptions, of my own growing, raised and grown with the help and labor already accounted for, so that there is only the use of the outside land to account for, and as I charged full value for use of that occupied by the house, thought would let it go at that."

The Buttercup.

I would like some one who has been successful in growing this carnation to describe his methods and conditions. Does it do best in heavy soil, or light loam? What temperature suits it best? The florists of this city say Buttercup cannot be grown here. I think it can, with proper treatment.

Springfield, Mass.

H. G.

DEVICE FOR SPRAYING LIQUID INSECTICIDES.

Grace Wilder.

I grow carnations only, and last season I cut 26,000 blooms from 700 plants of Grace Wilder. I have 1300 plants and in spite of the dark, cloudy and rainy weather, they are doing better than the average hereabouts.

Springfield, Mass.

H. G.

Heating Hotbeds.

The sketch shows the manner in which Geo. Klehm, a florist of Arlington Heights, Ill., has arranged his hotbeds for heating by 4-inch hot water pipes. The bed is built up against the sides and ends of the greenhouses, the outer wall being of brick as shown. From the wall a 12-inch plank extends out over the hot water pipe, the inner edge being supported by 2x4 uprights (shown by dotted lines) placed at intervals. The sash laps about four inches on the plank. With this

arranges the heat from the pipe diffuses evenly over the bed without the liability of injuring any plant through too close contact with the pipe and permits all of the space covered by glass to be fully utilized.

Device for Spraying Liquid Insecticides.

Florist Whiting, Wellsboro, Pa., sends the accompanying sketch of a device for quickly and effectively applying liquid insecticides. He has found it a great saver of labor and time in this work. Fill the can (3) with the insecticide through the opening closed by a screw cap (4), attach to the hose (5), open the stop cocks (2-2) and the insecticide will be forced out in a spray through the fine rose (1). The one which he has had made for his use holds two quarts.

News Notes.

FLATBUSH, L. I.—We regret to learn of the decease of the only daughter of Mr. and Mrs. Gas W. Bennett Feb. 26 last.

ST. PAUL, MINN.—The Society of Minnesota Florists held its semi-annual meeting at the Metropolitan Hotel, this city, Wednesday, March 12.

NEWARK, N. J.—Geo. Newbold, the Davis avenue florist, has leased his greenhouses for a term of ten years to Daniel Wettlin, formerly of Hornellsville, N. Y.

MINNEAPOLIS, MINN.—It is reported that A. J. Harris, of Niles Center, Ill., proprietor of the Paris Floral Store here, will close the establishment at an early date.

HORNELLSVILLE, N. Y.—Daniel Wettlin has sold his greenhouses here and removed to East Newark, N. J., where he has leased the greenhouses belonging to George Newbold.

KANSAS CITY, Mo.—Newell & Kidd have removed to handsome new quarters at 16 West Twelfth street, which have been elegantly fitted up. They intend later to build a conservatory in the rear.

WOODBURY, N. J.—The greenhouses of J. C. Gibson were almost entirely destroyed by fire early on the morning of March 7, supposed to have originated from a defective flue. Loss is estimated at \$2,000 with no insurance.

SPRINGFIELD, MASS.—Edmund W. Clarke, for nearly 20 years a florist in this city, died at Northampton March 5, from paralysis of the brain. He was born at Easthampton April 5, 1833, and was consequently in his 56th year.

UNIONTOWN, PA.—Please correct the statement in Feb. 15 issue to the effect that Chas. E. Stenson had rented Barton

Bros., greenhouses, etc. The facts of the case are, he and H. Hughes have formed a partnership and will conduct the said business under the firm name of Hughes & Stenson. Both parties were formerly at Wilkes Barre.

UTICA, N. Y.—J. W. Alexander, the Mandeville street florist, died Feb. 3, of pneumonia, aged 68 years. He was born in Sussex, England, came to Utica in 1853, and had been at the present business location for 33 years. His wife died just 11 days before he did. The business is being carried on at present by Mr. G. W. Chatfield, a son-in-law of deceased.

ASHTARULA, O.—The estate of Mr. F. E. Fassett is now in course of settlement. Mr. Fassett died Nov. 26 last from tumor of the bowels. He was 46 years of age, was born in this city and had always lived here. He and his brother Jas. A. Fassett had been in the florist business for about ten years under the firm name of F. E. Fassett & Bro. His brother will continue the business.

CLARKSVILLE, TENN.—A terrible cyclone passed over this place February 25 and did great damage all through this section. One of the largest greenhouses belonging to J. J. Crusman—20x100—was completely destroyed. A large chimney was first thrown on to it, which made a hole for the wind to enter, and the entire house was carried nearly 100 feet away. Fortunately very little injury to plants.

GLEN COVE, N. Y.—Mr. C. M. Pratt, of Brooklyn, has bought about 700 acres of Dosoris property, contiguous to Mr. C. A. Dana's, and intends building upon it country residences for himself and each of his several children. Mr. James Holloway has been engaged as his gardener. In connection with his Brooklyn residence Mr. Pratt has one of the finest private greenhouse establishments near New York. Mr. David Rose is his head gardener there.

LONDON, ONT.—Trade up to the present has been equal, or probably a little in advance of other seasons. Owing to so much sickness, there have been but few festivities, and consequently the demand in that direction has been but a small one, but the increased demand for funeral flowers has made returns about equal. At the last meeting of the Florists' and Gardeners' Club, it was decided to hold a chrysanthemum show Nov. 4, 5 and 6; a prize list was adopted in which prizes to a considerable amount are offered. To ensure success in the undertaking, a sufficient amount to cover all expenses has been guaranteed by members of the club.

A C. O. D. Order.

Messrs. F. Morat, Sons & Co. send us an "order" received by them from Texas which is not bad. It reads as follows: "Dear Sir, would like to have a variety of your flower seed and one Runing Rose can settle for them on Delivery a Small amount like this I can send you in Postal stamps with respect."

A WHOLE PAGE IN THE FLORIST will cost you only \$42 for one issue and in it you can send your spring trade list to every wholesale buyer in the United States and Canada. We can do you more good for less money than a list printed and mailed by you. If your list will go in a space of one half page, it will cost you but \$21. Send in copy at once for April 1 issue, not later than March 24.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant ads. not admitted under this head.

SITUATION WANTED—By experienced and competent gardener and florist. Private place preferred. L. BUCHENHOF, box 285, Norfolk, Neb.

SITUATION WANTED—Gardener to private place, 14 years experience. Young man, married, no children. BROWN, 816 Garfield Ave., Jersey City.

SITUATION WANTED—By a lady to learn the cut flower trade. Am acquainted with book-keeping. Address D. R. BURR, 465 6th St., Englewood, Ill.

SITUATION WANTED—As rose grower, by a thorough practical man. Married, no family. Address FLORIST, 13 Draper St., Rochester, N. Y.

SITUATION WANTED—By a young man (20) near New York. References from J. M. Keller, Bay Ridge, and H. A. Dreer, 714 Chestnut St., Phila. Address P. DAVIS, 13 Bay Ridge, L. I.

SITUATION WANTED—(Gardener, 8 years' experience) thoroughly understands roses and violets and care of greenhouses and nurseries; references Address JAS. SUTHERLAND, Jr., Winchendon, Mass.

SITUATION WANTED—By single man; expert scented florist; understands growing of roses and all kinds of cut flowers. Also experienced in putting up steam or hot water boilers. Apply to J. WIDLEY, Mt. Washington, Md.

SITUATION WANTED—By a young man, florist wishes a steady engagement by lat of April; good in propagating and growing all kinds of cut flowers and plants; 12 years' experience. Address K. C. care American Florist, Chicago.

SITUATION WANTED—As gardener on private place, 15 years' experience. Understands the growing of plants, cut-flowers, fruit and vegetables. English; single; age 28. First-class references. Address G. FARRANT, 1359 1st St. N. E., Washington, D. C.

SITUATION WANTED—By a young man under 20 years of age, private place preferred, 3 years' experience in general greenhouse work. Am very strictly temperate, good references, will be open for an engagement April 1. Address WILLIAM STUART, Winchendon, Mass.

SITUATION WANTED—By an experienced gardener and florist, in greenhouses and nurseries, first class rose grower and propagator, best of references for 20 years, for private or commercial business, married. Address H. E. NIEMELA, West 23th St., Erie, Pa.

SITUATION WANTED—Private or commercial, by a young man, gardener and florist; age 27; single with 3 years' experience in greenhouses, garden, nurseries and landscape gardening. Good references if wanted. Address J. B. care John Breitmeyer & Sons, Detroit, Mich.

SITUATION WANTED—By a well experienced florist, an foreman in a commercial or a good private place, understands all kinds of plants, cut flowers and vegetables, 15 years' experience, first class references, married, Sweden, well preferred. Address CHARLES LARSON, 180 Prospect Ave., Kansas City, Mo.

WANTED—An experienced rose grower; married man without large family preferred. First class recommendations required. Address M. care Wm. J. Stewart, Boston.

WANTED—To engage for next winter's firing, either hot water or steam, to work under glass all that time, but would prefer constant work in houses. Address J. T. TURNER, Salem, Ohio.

WANTED—A first class rose grower, one who can come well recommended to be capable to take charge of a good sized plant and not afraid to work himself. Address Box 10, American Florist.

WANTED—Florist who thoroughly understands the business of propagating and growing roses and cut flowers for market; wages \$75 per month; references required. Address ROSE WRIGHT, 12 E. 4th St., Spokane Falls, Wash., Ter.

WANTED—A propagator of roses, grapes and clematis, to care for six houses; must be temperate and a good workman. Write at once stating wages expected and give references. Address WASHINGTON ST. NURSERY, Geneva, N. Y.

WANTED—A single man fully understanding a florist business, to take care of garden and make himself otherwise useful at an Adirondack hotel. Address with references T. EDMOND KATZMOLZ, Waukegan, Franklin Co. N. Y.

WANTED—Thorough practical florist, single man, experienced in rose and general plant growing able to take the lead among four assistants; wages \$30 per month and board. None but competent need apply. Must be well recommended. Address JOHN RECK, Bridgeport, Conn.

WANTED—To correspond with a live American born German Catholic, with a view to establishing a florist and market garden business, in a New York city of 500,000; no competition; good experience, and capital required. Married man preferred. Address J. H. care American Florist.

WANTED—A florist clerk, single man, good maker up, must have a general knowledge of the business, and experience in taking orders, and should be energetic in matters. Wages \$30 per month and board, situation permanent, good references required. None but competent should apply. Address JOHN RECK, Bridgeport, Conn.

WANTED—A young man about 23 or 24 years of age as assistant gardener, one with some experience in the growing of grapes, pomegranates, etc., and who has held two or more similar positions previously and who can come well recommended, English or American. Address N. BOX 155, Varmouthport, Mass.

FOR SALE—Windmill with pump and pipe; all in good repair. Cheap. GEO S. BELDING, Middletown, N. Y.

FOR SALE—One Eleven Section Carmody hot water boiler, as good as new. Will sell complete outfit for \$75.00. J. J. SCHMIDT, Sioux Falls, S. Dakota.

FOR SALE—If you are looking for a good opening for a retail florist business and have about 2,500 ready money, you should address F. care American Florist.

FOR SALE—An eight years' established florist business in a live city of 40,000 centrally located. Address for particulars 309 E. 1st St., Duluth, Minn.

FOR SALE—A first class retail mailing trade, with addresses, good will etc, parties desiring to buy and meaning business, address S. I. X, care American Florist.

FOR SALE—A very nice house with 70 acres of land; 1 acre woods, 6 greenhouses, dwelling house, barn, wagon and buggy, stock of plants, etc. For further particulars apply on premises to F. J. DOUGLAS, Cor. Langley Ave. & 40th, Chicago.

FOR SALE—Desirable greenhouse establishment, 6 established years, 6 greenhouses, dwelling house, barn, wagon and buggy, stock of plants, etc. For further particulars apply on premises to F. J. DOUGLAS, Cor. Langley Ave. & 40th, Chicago.

FOR SALE OR LEASE—For the want of time to give the requisite personal attention I will sell or lease my place, comprising two acres and 12,000 feet of glass, all well stocked, near Chicago. Reply to C. American Florist.

TO LEASE—Six greenhouses advantageously located and well stocked in same for sale, consisting of hydrangeas, callas, roses, carnations and good assortment of bedding plants for spring sales. Address SARAH W. STOKY, Brighton, Mass.

FOR SALE—Florist establishment, seven houses and store, with good retail trade. House stocked and everything in the first-class order, in the center of the city of Chicago. Very cheap rent and best location. Good place for a right man. Address A. N. care American Florist.

FOR RENT—Four greenhouses heated by hot water; well stocked with miscellaneous plants. Will sell stock cheap. A No. 1 opportunity for live man. Worth investigating. Business comes and closing out. Write for particulars, or come and see. E. J. MILLER, Downers Grove, Ill.

FOR SALE—A florist establishment, one greenhouse 75x15, and two 75x10 feet each, heated by hot water (weathered); 25 acres of good land, some wood and pasture, plenty fruit; dwelling house, barn and other out-buildings; good well and cetera. All buildings new and in good order. Near New York City. One mile from depot. Price, \$4,800. Address F. O. Box 109, Ramsey, N. J.

FOR SALE—A well appointed wholesale floricultural establishment; 32,000 square ft. of ground, City. All cut flowers are sold on the premises to first-class retailers, and the demand exceeds the supply. Excellent location given for selling roses. \$80,000, one-third cash, balance on bond and mortgage. For particulars, address THE W. W. TURNER'S SONS, 46 and 48 Marion Street, New York City.

FOR SALE—A grand opportunity to any one about building greenhouses. The underground well (with or without land) their entire plant at a great bargain, consisting of about 25,000 feet of glass, 750 feet of ventilating apparatus (Hutchings & Co.), 7,000 feet of 4-inch pipe, two No. 18, one No. 19, one No. 16 and one conical boiler, all in first-class order, and made by Hutchings & Co. Houses only been built a short time. For further particulars, apply to J. ERUS, P. O. Box 212, South Orange, N. J.

FOR SALE—The leading florists business in Topeka, Kan., the Capital and largest city of the State. Demand and business constantly increasing. Population doubled in the last five years. People cultured, and one of the finest cities of the West. Large shipping trade. Most widely diversified and best known florists business in the State. Business cash and ready money. Best of reasons for selling. Can be had at a bargain for cash. Correspondence solicited. Address PAUL M. PIERSON & Co., Topeka, Kansas.

WANTED. First-Class Vegetable Gardener, To take charge of 20 acres. Must be single man, of good habits and able to furnish satisfactory testimonials as to character and capability. Address, with references, Supl. Northern Insane Hospital, ELGIN, ILL.

1890 Every Florist, Nurseryman and Seedsman should have one.

DIRECTORY. AMERICAN FLORIST CO., Chicago.

Looking Backward.

Many years ago—back in the nineteenth century, when the trade was comparatively in its infancy, the methods of conducting the business were naturally very crude. The present standard plant classification was then unknown and when a plant grower advertised his product for sale to the trade he designated the size and quality of the plant by the size of the pot (an earthenware receptacle in which plants were then grown). This of course gave a chance for a remarkable stretch of the imagination as to what the plant really was, and well illustrates the many disadvantages under which buyers and sellers then labored.

Toward the latter part of that century history shows that the catalogue business first began to develop to some extent, and a collection of catalogues of that time, recently unearthed in the garret of an old house, proved to be a veritable mine of curiosities. Many of the ancient style of engravings on wood were most remarkable, and some of the colored engravings (called colored lithographs at that time) were simply absurd, and show that in those early days the publishers of catalogues considered a gaudy dab of color necessary to draw trade from the people, who must have been very crude indeed to have been pleased by such burlesques upon nature. The lists of plants offered were even more lengthy than those of the present day, for then anyone could easily force the sale of any plant, however valueless. There was then no way to authoritatively establish the value or worthlessness of new introductions except to buy them and try them for yourself, and frequently new but worthless plants met with an extensive sale, considering the scantiness of the population at the time. The public experimental gardens now established on every isothermal line, in which every new plant is tested before it is allowed to be offered to the public were of course then unknown.

The gradual evolution of the method of handling cut flowers is quite interesting. Previous to 1900 the flowers were in some cases carried to the retailer by the grower, and in others were shipped by the grower to commission dealers of which there were a number in each large city. There was but little attempt made to classify the stock as to quality, and the different dealers acted entirely independent of each other as regards establishing prices. The present system of a cut flower exchange in every city connected by electrophones and express tubes with a main exchange where the trade of the whole country is regulated by instantly supplying any shortage at one subordinate exchange with the surplus at another was then undreamed of. As before stated there was no reliable system of classifying the stock as to quality and when a dealer in one city wished to buy from one in another he sent a message by the ancient telegraph, specifying merely the variety of flower or flowers he desired, and the one receiving the order filled it with any flowers of that variety he had, so that the buyer never knew what the quality would be until it arrived by the "express train," the most rapid method of freight transit then known. How long could we transact business now-a-days with any such lack of system? Some are now claiming that our present elaborate classification as to quality can be improved upon. If a florist of that day could be brought to life to view the scenes which would now meet his eye how he would be amazed at the way our brokers

buy and sell on the cut flower exchanges, for buying and selling futures was then confined entirely to food products.

From the early records it appears that the first attempt upon the part of the florists of America to organize, and unify their interests was made in 1885 when the "Society of American Florists" was formed, and the proceedings seem to at first have been very crude, though probably of considerable value to the trade at that time. Even as early as 1888 some attempt was made to place the trade upon a better footing through the instrumentality of the society, but even such mild measures as those advanced by the more progressive men of the day were apparently met by considerable opposition. It was not until early in this century that our present national organization with local supervisory committees at every large trade center, was established.

Many other curious and interesting facts connected with the early history of the trade are revealed by a careful study of the early volumes of the AMERICAN FLORIST (originally published semi-monthly), and the printed proceedings of the Society of American Florists, and with the editor's permission I may mention them in subsequent papers.—E. B. in *American Florist*, August, 1985.

TARRYTOWN, N. Y.—F. R. Pierson, the well known florist, has bought a tract of land near Sparta, upon which he will build four greenhouses, each 304 feet long, and together containing 30,000 feet of glass. Work has been commenced and the buildings are to be completed by about July 1. The cost will be \$25,000. Paul M. Pierson, who has for several years been in the business at Topeka, Kansas, will have charge of the new establishment.

OUR NEW TRADE DIRECTORY is now ready. It gives a complete and accurate list of the florists, nurserymen and seedsmen of the U. S. and Canada. Price \$2.

PRINT your spring trade list in the next issue of the AMERICAN FLORIST and mail copy for same as early as possible.

100,000 ROSES 100,000

We have doubled our facilities for growing roses of all sizes, and will be glad to price your lists whenever and whatever you may need. Three acres under glass. Most complete and most select collection in every department. Send for Wholesale and Retail Descriptive Catalogue.

ADDRESS **NANZ & NEUNER,**

THE ROSE OF THE YEAR.

CALIFORNIA'S NEW ROSE

"THE RAINBOW."

— THE ROSE FOR EVERYBODY! —

**The most Vigorous, Free-Blooming, Forcing
Rose ever Introduced.**

A most lovely Rose of a deep Mermet pink, striped and splashed in the most fanciful way with deep Gontier color, but only enough to add to its beauty, and with base of petals of rich amber. Flowers well carried on long stiff stems, of the same shape as Gontier but most decidedly larger, sweeter and of greater substance.

Remember, "**THE RAINBOW**" is a sport from Papa Gontier, one of the most popular Winter-bloomers. It will do well with everybody. It surpasses its parent in freedom of growth and bloom by far. Experience has taught, that sports from Winter-bloomers have proved to be Roses most fit for the same purpose: for instance, The Bride, Duchess of Albany, etc.

"**THE RAINBOW**" is only offered to the trade. Cut flower growers as well as nurserymen will certainly see the advantage of getting a new American Rose which offers such inducements to each of them.

I am ready to book orders now. All orders will be filled strictly in rotation, commencing July 1st, 1890, at the following prices:

1 PLANT, \$1. 12 PLANTS, \$10. 100 PLANTS, \$75.

The plants will be from 3-inch pots, placed out of doors during June, so as to stand shipment well.

JOHN H. SIEVERS,
25 POST STREET,
SAN FRANCISCO, CAL.

"**THE RAINBOW**" received the highest award in the gift of the California State Floral Society at their last Fall Exhibition.

NOVELTY FOR 1890.

OUR NEW ROSE SNOWFLAKE

Perfect flowers; creamy white; fragrant; free flowering; for funeral work; for wedding work. It will make up in designs as prettily as an aster. Can be grown profitably at \$1.00 per hundred blooms. Why? Because it will out-bloom, two to one, the same space devoted to carnations. It is a European seedling, but the name has been lost, so we call it **SNOWFLAKE**.

We have put the price **LOW—ONLY \$12.00 PER HUNDRED**—from 2½-inch rose pots.

It is free from mildew; free from black spot; a pure tea rose; never has any disease; can be grown among other roses with perfect success and does not require special culture; and it is as easy to grow as a Safrano. We have counted one hundred and forty-three buds and blooms at one time on a single bush nine months old. For pot purposes it is unrivalled, as the constant succession of blooms gives a longer period in which to market it. We have tested it two years and it has bloomed freely even during the past winter.

—**AGAIN, MARK WHAT WE TELL YOU,**—

The **WOOTTON** Has Come to Stay

This past winter it has produced *ten times as many blooms to the square foot of glass as either the American Beauty or Bennett*. Come and see it in bloom now in our greenhouses.

AN OFFER: Let the AMERICAN FLORIST COMPANY select three competent florists, living within a radius of eight hundred miles of Washington, to inspect our Woottons between the 15th and 30th of March, and to give a verdict thereon. We will supply them with round-trip tickets, and care for them while here.

Our Specialty is Rose Growing Under Glass for Buds and Plants.

Below we give you a list of varieties we can supply you from 2½-inch pots:

OLDER VARIETIES.

PERLE,

EXHIBITIONS.

Exhibitions of flowers and plants are held to be great educators of the people, but alas! they are frequently expensive for those who give them. Anything, therefore, which accomplishes the object desired without subjecting the would-be reachers to unwelcome expense is certainly to be commended and is worthy of imitation.

Last April there was held in Detroit an exhibition which, while hardly a model one from the florist's standpoint, unquestionably accomplished a great deal of good, for the great weakness of most exhibitions—lack of attendance by the people whom it is desired to benefit—was overcome. It was visited by over 30,000 people in the four days it was open, and was consequently a financial success.

This exhibition was not given by a horticultural society or a florists' club. It was planned and executed by the publisher of a newspaper—the Detroit *Daily Journal*—with the assistance and co-operation of those interested in the various city charities, among whom the net proceeds were divided, leaving the florists free to devote their entire time to preparing their exhibits and competing for the premiums offered. It was not a floral exhibition pure and simple; it was a huge charity fair with a flower show thrown in, and, under Mr. Brearley's management, made far from the incongruous combination which might be expected. Each of the charities had a booth and had selected some one flower which it kept on sale, and the decorations of some of these booths were decidedly artistic and in keeping with the floral surroundings. And how the people did turn out and flock to this exhibition! In the evenings it was a perfect crush.

The floral display was far below many others which have been but meagerly attended, why then this outpouring? First the manager had a daily paper at his disposal. Its columns were filled with talk about the exhibition for months in advance. It was exceedingly well advertised. Second, he had enlisted the sympathies of the public by offering to divide the net proceeds among the city charities, and at the same time had secured the active co-operation of the people interested in each of these charities and through them the influence of their following. He brought all the active workers in the cause of charity together and united their energies in the work of making the exhibition a success, and it was a success. The premiums and expenses were all paid, each of the charities received a snug sum, and 30,000 people were brought into closer relations with plants and flowers.

This year music will be added to the attractions. An organ is being built expressly for this affair, and a chorus of 400

voices is now rehearsing. This in addition to a full orchestra. Two buildings have been connected for the festival, and arrangements are being made for a more elaborate display of plants and flowers—plan is given on another page. Judging from the way people flocked in from all over the state to the last exhibition, the coming one should be visited by from 50,000 to 75,000 people. Is not such an exhibition of very great benefit—for you can't educate the people through the medium of an exhibition unless you get them to come to it—and can not other cities profit by this example? If the conventional exhibition does not draw the people and this style does draw them, let us have this style. After they have enjoyed these for a while, they will develop a taste for the finer products of the gardener's skill.

HYDRANGEAS FOR EASTER.

On another page we present an illustration of a new hydrangea, but we expect the engraving to do something more than illustrate that variety. We expect it to show to those florists who have not yet devoted their attention to growing such plants for Easter sales what golden opportunities they are over looking. Take a look at the plant illustrated and then ask yourself how you think such would sell at Easter time. Couldn't you sell lots of them, and at a good price too? Of course you could. Well, why don't you grow them then? You ought to grow anything which you can sell quickly and at a good price. But this isn't all. Easter blooming plants are all cleared out of the houses in time to fill up the same space with bedding or market plants. There is good money in growing these plants for Easter sales and if you don't get your share it is your own fault. It has grown to be a very important branch of the trade in most large cities, and it will be just as important in your smaller city if you place a stock before the people. You will find the methods of one very successful grower of hydrangeas for Easter sales, described on page 496, June 1 issue, of last volume.

CARNATION SILVER SPRAY.—A bunch of twenty-five blooms of this carnation, recently sent us by Geo. Hancock, Grand Haven, Mich., were the best white carnations that ever came to this office. Handsomely formed, of large size, perfect calyx, delightfully fragrant, and on stout stems, none less than eighteen inches in length, covered with clean, handsome foliage. Certainly Silver Spray is the white carnation for Mr. Hancock to grow, for the specimens of Silver Lake and L. L. Lam-born which came in the same box were completely overshadowed by it.

CERTAINLY the catalogue published by the B. A. Elliott Co., Pittsburg, is the richest and most artistic one we have yet seen. It is a work of art and a credit to the trade. Much new matter has been added this year to the valuable cultural instructions which precede the catalogue proper, among which is included a beautifully illustrated article on "Newport Gardens." Such a catalogue will be carefully preserved by all recipients, and can not fail to encourage a taste for the beautiful in nature.

PINK PERLE.—Mr. P. H. Meehan, Richmond, Va., sends us a bloom produced by a sport from Perle des Jardins and which he labels "Pink Perle." The bloom was about the size of a small Perle, of a pink shade, though decidedly washy when it

reached us. Of course color and size may improve with the strength of the plant, but what use have we for a pink Perle? Do we want one, and will it pay Mr. Meehan to work up a stock of it? We seriously doubt it.

CO-OPERATION.—Mr. Bearn's essay which appears in this issue contains a suggestion that should receive full consideration by the various Florists' Clubs. Should the plan prove practicable the direct benefits which would accrue to every member would be very considerable. There are certainly great possibilities in that direction.

PLACE ALL your orders this spring with those who advertise in the AMERICAN FLORIST. Our advertisers are all reliable men, and if any prove otherwise we will take it upon ourselves to secure justice to the customer. We refuse advertisements from any we deem unreliable.

AN ERROR.—Our attention has been called to an annoying error in the quotation from Bryant which concluded the tribute to John Henderson in last issue. In the second line of the last verse the word "appointed" was made to read "appropriate."

IF YOU KNOW of any plant which is traveling under two names report the same at once to the Committee on Nomenclature. The full committee with address of each member may be found in another column.

WE WOULD LIKE a clear, distinct photograph of a specimen plant of *Adiantum Farleyense*, also one of a plant of *Adiantum cucumern* in about a 4-inch pot. Will any one having such please favor us with a copy.

NUMEROUS REPORTS of largely increased trade are very gratifying. The florist trade of America is practically still in its infancy, but it is a lusty, sturdy infant and is growing vigorously.

THIRTY-SIX PAGES this issue. Four pages above the previous high water mark. The FLORIST has not yet attained its growth. It is still on the upward move.

EASTER comes early this year, April 6. Are you going to strike it with a good crop of bloom?

shipped C. O. D. Telephone connection. Use A. F.
Code when ordering by telegraph. For prices, etc.,
Address,

J. L. DILLON, BLOOMSBURG, PA.

Steam Heating.

Will some of the readers of the FLORIST who are using steam please state how many hours they can leave the apparatus at night without attention? I put in steam in part of my houses last fall, and have been obliged to keep a man to attend to it at night. It was claimed that it would run eight hours without attention, and I would like to know whether other florists have found it safe to do this.

JOHN RALPH.

Saratoga Springs, N. Y.

100 per cent off.

It is not always the outsider who wants the earth. A florist recently sent in a list to be priced, with the appalling announcement that "Catalogue men always throw off 100 per cent on list prices." Bcd.

A. T. MERRICK, HORTICULTURAL ENGRAVER, Room 711, Chicago Opera House Block, CHICAGO.

Washington.

The Florists' Club of Washington entered upon the second year of its existence last evening, having a membership of thirty-three. The annual dues were reduced from \$3 to \$1. By the kindness of Mr. Wm. R. Smith, Superintendent of the Botanic Gardens, the club has been afforded a well adapted meeting room free of charge. Money was accumulating, and the \$3 rate bore rather heavily where several members of one family or firm belonged to the club, so it was deemed wise to make reduction for the present at least.

The club is largely composed of florists who have stands in the famous Centre market of this city. Their business has long since outgrown the accommodations the market company can furnish them in the main buildings, where they are interspersed among all sorts of produce dealers. Be it known that fully half of the flowers of the city are sold at this same Centre market. Very naturally the subject having the greatest interest for the club at present is the agitation of a scheme to secure new and suitable accommodations, if possible, still in connection with Centre market. The discussion is gradually maturing plans for a beautiful iron and glass floral market directly upon Pennsylvania avenue in front of the market which will furnish room for all now in business in this vicinity and give room for extension, beside quarters for seedsmen and horticultural belongings. They have a big job on their hands to secure this privilege of so choice a location, but believe they can accomplish the undertaking.

Robert Bowdler was elected president for the ensuing year, P. Gages, vice-president, Wm. S. Clark, secretary (re-election), Eugene Cadmus, corresponding secretary, and Adolph Goode, treasurer. C.

OUR NEW TRADE DIRECTORY is now ready. It gives a complete and accurate list of the florists, nurserymen, and seedsmen of the United States and Canada, designating the special branch of the trade each one is engaged in. Price \$2.

TO GIVE the FLORIST your fullest support, confine your orders as far as possible to those who advertise in its columns.

Hot Water in 2-inch Pipes.

In March 1 issue "A Beginner" asks the advice of some one who has used 2-inch pipe for hot water heating. We have used them to our sorrow. Have remodelled them twice, and next year we will tear them all out and use 4-inch pipes. Have tried 2-inch pipe for three years, and it has cost us \$3,000 to learn they are worthless. Some people claim they get hot quicker than 4-inch. Well, maybe they do, but, if so, they will also get cold quicker. Again, it is claimed because they get warm quick it requires only half as many 2-inch as 4-inch. We have found it takes twice as many 2-inch, and then it does not do the work. It requires a great deal more coal to heat 2-inch pipe than it does 4-inch. We would not use 2-inch another winter under any consideration.

ROBT. S. BROWN & SON.

Kansas City, Mo.

—In answer to "A Beginner," March 1, we have a rose house on John May's plan, 100x18 feet. Use the 2-inch pipe, on the high pressure plan. Heats quick, and there is a saving on fuel. Expansion tank should be located near the boiler at the highest point. An ordinary size barrel can be used as tank. We use 1000 feet pipe. This house would require 800 feet of 4-inch pipe.

WM. BLACKMAN & SON.

Evansville, Ind.

Any one with a cellar or stable can do it. Our pamphlet, "How to Grow Mushrooms," gives full instructions. Send for it. A trial brick of Mushroom Spore (enough to plant a space 3 ft. by 4 ft.) sent by mail, to any address for 22c. 10 lbs., by exp. for \$1.50. 50 lbs. for \$6. Our handsomely illustrated catalogue of Vegetable, Flower, and Farm Seeds, and all requisites for Farm, Garden, and Lawn, free to all.

P. A. BALLER, Bloomington, Ill.

Asparagus Tenuissimus.

Asparagus tenuissimus has come to stay says Mr. John B. Keller, and I believe he is right. As the saying is, "figures don't lie," so compare the quotations for the winter months on asparagus and smilax. The highest that smilax has been this winter is \$35, and some months it has dropped down as low as \$10. The lowest price to which Asparagus tenuissimus has dropped this winter is \$25, and at times it has brought \$50, while A. plumosus has brought as high as \$75. I don't understand why florists do not grow it more extensively, for it can be grown as easily as smilax.

My method of growing it differs somewhat from that of Mr. Keller, as I believe more and more in shallow planting. I make the bed ten inches deep with plenty of drainage and raise the bed eighteen inches from the ground, which allows the heat to circulate under the bed, thereby inducing a quick growth. I also feed heavy with liquid manure as often as once a week.

There is nothing that fills the bill here for green as this vine, as it stands well in a warm room and looks fresh long after smilax has completely dried up. I don't want to run down smilax, but for private use asparagus takes the lead.

Bay View, Mass.

H. C.

Still Later.

Noting the statement regarding late chrysanthemums by S. H. B. would say that I am cutting blooms from Mrs. Brett, Old Gold, Thunberg and A. S. L. White up to this date—March 5, and expect to cut for Easter. A. S. L. Pittsfield, Mass.

CYCAS REVOLUTA,

In all sizes from 8 inches to 3 ft. high, laid down in San Francisco, freight and all other charges paid.

Pot-grown, well established plants, with root balls (root balls excluded), per 100 lbs. U. S. currency, \$18.00.

Open ground, well rooted, out of my Yokohama nurseries, per 100 lbs., U. S. currency, \$15.00.

Freshly collected, prime quality, per 100 lbs., U. S. currency, \$12.00.

[Orders for less than 500 pounds cannot be executed, as orders for a few hundred pounds would cost too much freight in proportion.]

RHAPIS FLABELLIFORMIS.

Also laid down in San Francisco.

Fine cultivated pot plants, from 18 inches to 2½ feet high, per 100 shoots, U. S. currency, \$30.00.

The same, freshly collected, per 100 shoots, U. S. currency, \$10.00.

TERMS, Cash with order or letter of credit to draw against.

H. W. WILLIAMS & SONS, Batavia, Ill.

Chicago.

The annual dinner of the Chicago Florist Club was decidedly a most enjoyable affair. Though some thought the club was flying a little too high in the arrangements for the occasion, there were no empty seats and some of the hardest grumblers enjoyed the banquet room with their presence. The eatables and drinkables were eminently satisfactory, and the after dinner remarks both pointed and witty. That all present most thoroughly enjoyed themselves was evident from the opinion generally expressed that "we ought to have them oftener." The table was handsomely decorated with blooming azaleas and numerous bowls of roses, among the latter being one containing fifty splendid blooms of the much abused Wootton, sent by Messrs. C. Strauss & Co., Washington.

The club has issued an advance sheet giving the premiums to be offered for chrysanthemum plants and cut flowers at its third flower show which will be given next November. Copies may be had on application to the secretary, 54 La Salle street. The complete premium list, with specials etc., will be issued in September.

The New York Tribune reports that the *Rural New Yorker* has been purchased by Lawson Valentine and E. H. Libby. The former editor, Mr. E. S. Carman, will still remain as editor in chief.

SPECIAL 30 DAYS OFFERS.

I have made a specialty of growing the choicest strains of Flower Seeds for 15 years. The strains here offered have been awarded

13 FIRST PRIZES

by the Mass. Horticultural Society. I want every florist to try at least a few this year, and for 10 cts. will send my new Catalog and 6 pkts. 20 to 50 seeds in each, including 35 varieties choicest DOUBLE ANTERS, mixed; 50 vars. PANSIES; GYNOPHILA or WINE FLOWER, elegant for floral work; 42 vars. IMPROVED SWEET WILLIAMS. Catalog contains no elegant and artistic colored plate. BLUE AND PINK ZANZIBAR WATER LILIES, the only plate of these magnificent Lilies published in this country. They will bloom in pans, tubs or tanks in open air in summer and house in winter. They are as easily grown from seeds as asters, are sure to germinate in a few days, and make a remarkably rapid growth, and begin to bloom FOUR MONTHS FROM SOWING SEED, continuing in flower for months. IT WILL PAY EVERY FLORIST TO GROW THEM.

Trade price, packets of 50 seeds, blue variety, 20 cts.; pink variety, 30 cts. Directions with each packet.

SPECIAL INTRODUCTION OFFER!

FOR SIXTY CENTS or thirty-two letter stamps I will send EVERYTHING MENTIONED IN THIS AD., above and below, IN PACKETS, AMOUNTING TO \$2.20 AT RETAIL.

EUPHORBIA HETEROPHYLLA,

(Fire Plant or Fire on the Mountain). A splendid new annual foliage plant from Mexico; 3 feet tall, very branching and leafy; leaves 2 inches long; those on the ends of branches blotched with fiery scarlet after manner of Fuchsia. Easy to grow, and valuable for decorative purposes. (See note by W. F. in FLORIST, Oct. 1889).

FROM A SETOSA or Brazilian Morning Glory, is the most ornamental of all annual vine, climbing 40 ft., with immense leaves, often a foot across. Every part of the vine is covered with conspicuous reddish hairs. Flowers large, of a beautiful rose color, borne freely for months. This is entirely distinct from all other FROMEAS, and a genuine new variety, of which I have the entire stock this season. 50 vars. Japan Pinks; 38 vars. Improved Double Poppies; 10 vars. Double Portulacas; 30 vars. large flowering Drummond Phlox; new Pansy Park Prize strain; 5 vars. superb new Godetias; 10 vars. Battery flower; Giant White Chastity; true Little Gem Sweet Alyssum (as originated by me), very valuable for florists.

ALBERT BENZ, Douglaston, N. Y.

To Kill Slugs.

In answer to my enquiry in FLORIST of February 1 for a remedy for the presence of a soft slug among my violets in a cold frame, Mr. John Mull, of Dayton, Ohio, writes me that he has been troubled in the same way, and found quick relief by applying cigar factory tobacco dust thickly underneath about the roots. This remedy is simple, inexpensive, and from which no injury arises. Need not be afraid of a liberal application.

Taunton, Mass. GEO. P. CUTLER.

Slugs.

In answer to "R. E. S.," about slugs, will say, we know them well. A very small one can soon destroy a carnation flower, and we have lost hundreds this winter until we used the following: Add a teaspoonful of Paris green to a quart of dry oatmeal or bran, well mixed, and drop it about in small bunches where they frequent. It will do the work well. The slug generally gets away, but does not return.

The "PLANET JR." SEED DRILLS WHEEL HOES HORSE HOES

The "PLANET JR." No. 2 GARDEN DRILL, is beyond question the best; sows the most difficult seeds; opens, covers, rolls down and marks the next row with the greatest regularity.

The COMBINED DRILL and HOE, &c. The greatest favorite ever produced. Perfection as a Seed Drill, or as a Flow, Hoe, Garden Rake, Cultivator or Marker. Saves labor and seed and soon saves cost.

The DOUBLE WHEEL HOE. A money maker for farmers and gardeners. Works both sides of a row at once. Flows to or from, opens furrows, covers, cultivates, hoes, rakes and has leaf guards.

The SINGLE WHEEL HOE is a treasure. Beats the double in some crops; is lighter. Has a Large Plow, two Long Hoes, two Rakes, three Cultivator Teeth, and a Leaf Guard.

The FIRE-FLY SINGLE WHEEL HOE. Equals the last, except has no rakes nor leaf guard.

The FIRE-FLY GARDEN PLOW. Worth its price yearly in a garden 20x40 feet.

The GRASS EDGER. The newest, neatest, cheapest and best machine known for edging paths and flower beds.

The 1800 HORSE HOE. The finest tool and most costly to make that we have ever offered. Yet the result justifies our care, as every one who sees the tool will admit. The first grand improvement is our new patent Lever Expander, one all farmers admire and which they will pay \$3.00 for, to put on old machines. The next feature is our patent Handle Shifter, enabling one to walk to one side of his work, worth \$3.00 a day for some crops.

Yet we ask but a small additional price for both these fine features. Why not send for full descriptive catalogues of these and all our other S. L. ALLEN & CO. Patentees and Sole Manufacturers, useful improvements? Free to all.

S. L. ALLEN & CO. 1107 Market St. PHILADELPHIA, PA.

THE NEW HANDY DIGGER. A taking novelty, approved by leading florists and seedsmen. Handy for the greenhouse, conservatory, garden and lawn. Blade and shank one solid piece of steel. Just the thing for digging plantains. Price, 25 cents. One dozen to the trade, postpaid, \$2. Jobbers prices on application.

THE FLORAL SUPPLY CO., Binghamton, N. Y.

Largest Stock in America. NIAGARA and all old and new varieties. Extra Quality. Warranted true. Low prices. Introducers of the new Black Grape. Also other SMALL FRUITS. Describe your Catalogue Free. Send list for prices. EATON, T. S. HUBBARD CO., FREDONIA, N. Y.

Mild Winter in Ireland.

We are having an extraordinary mild winter in the south of Ireland. We are cutting daffodils of the Irish King variety in the open air and sending to Covent Garden market since February 10, and I expect to cut some "White Swan's Neck" daffodils for bouquets at the Vice-Regal drawing-rooms next week. This is extraordinary indeed for the open.

Cork, Ireland. W. B. HARTLAND.

The Chrysanthemum Centenary Festival.

At a meeting of the General Committee of the National Chrysanthemum Society on Monday evening, the schedule of prizes to be offered at the Centenary fete in November next was passed. Arrangements have been made for some sixty-seven classes, the first and foremost of which is the grand centenary class for forty-eight blooms, twenty-four Japanese and twenty-four incurved, all distinct, the prizes in which will be £25, £20, £15, £10 and £5—the largest amount ever offered in a single competition for cut blooms. Each exhibitor in this class will also be presented with a bronze Centenary medal.—*London Gardening World.*

SEND IN your records of number of blooms cut from a given number of plants, occupying a given space, during a given length of time. Give the number cut during each month if possible.

Hardy Plants.

EARLIEST SPRING FLOWERS.

It depends upon the season and location when our earliest spring flowers come into bloom, and there is no class of plants so variable in their time of blooming as are the spring flowers. In a season like this when the weather has been unusually mild the earliest snowdrops appeared about the end of January, four to six weeks earlier than they would have done were the season a rigorous one; again, while we have had snowdrops in bloom in a moist but warm, sheltered nook, the same species in an open cold exposure is nearly eight weeks behind the other. And so it runs with most all kinds but lessening in difference as the spring advances. And in shady places they are generally later than in sunny spots, thus triflings that may be in full bloom in a sunny nook in the middle of April may not be in blossom at all in the shady parts till May, and so on. The great majority of early spring flowers are of little use to the cut flower florist, they are not large or showy enough; their chief service comes in for the florist who deals in plants and bulbs, the florist who does jobbing gardening and uses them in beautifying the places he takes care of, and all progressive florists who delight in making their own homes cheerful and the exterior of their establishments inviting to the public. And many spring flowers are welcome auxiliaries as pot plants for midwinter or February and March decoration in greenhouses. Spring flowers should be planted in large quantity and where they can remain permanently in order to obtain good effect. And they should never be planted on bleak cold exposures, or in very poor ground. Most of them, the bulbous plants for instance, make rapid and full growth in spring and die down in early summer and remain dormant till next year, and this renders them very accommodating, because we can grow them under and around deciduous trees and shrubs, for while they are in full growth and bloom the trees are naked and almost shadeless; if in grass lawns they complete their growth before mowing begins, and if in flower beds or borders they disappear in time to permit the encroachment of summer-blooming plants without injury to either. With evergreen species, however, the case may be different, for while some, as moss pink and white rock cress refuse to thrive in shady places, others, like shortia and hepatica prefer partial shade. Again, while many plants will luxuriate all the year round in an open sunny situation providing the ground is good, moderately moist and loose or mulched on the surface, the same kinds of plants would die in summer if grown on an open, naked, hard, dry border.

The different kinds of Christmas roses and Lenten roses (*Helleborus*) may be styled our earliest flowers, for they, according to variety, may be had continuously in bloom from November till the end of April. *Helleborus niger* and its varieties are white flowered and the earliest; hybrids between this species and *H. Orientalis* are white spotted with green and purple and come next. The spring-blooming kinds are greenish or purple flowered and among the best of them are *H. Colchicus*, *H. odoratus purpurascens*, *H. Olympicus* and *H. Orientalis*.

The winter aconite (*Eranthis hymalis*) is the earliest of our spring flowers. It is a little yellow-flowered crowfoot, fit to grow in partially shaded places and somewhat moist good soil. The earliest snowdrops appear about the same time—February or March—and are now charming and esteemed little plants. The common one (*Galanthus nivalis*) is the form usually planted, and there is a fine fall-double variety of it. *G. Elwesii*, however, is the finest flowered species, and it is large and early, and the Crimean snowdrop (*G. plicatus*), large and late, should not be omitted.

Crocuses are the gayest of our spring flowers and last from February till the end of April. The varieties of *C. vernus*, *Susianus* and *versicolor* are the commonest in cultivation, but there are many other fine species. They will grow and bloom most anywhere, but to have them in perfection and year after year they require good ground, somewhat moist and slightly shaded.

Siberian squills and their lovely allies *Scilla amena* and *S. bifolia*, come into bloom about 10 to 14 days later than crocuses and are the most vivid of our spring blue flowers. All are easily grown and long-lived, and while they like partial shade the *S. Sibirica*, especially, is quite at home in open sunny quarters. It multiplies fast from self-sown seeds.

The *Chionodoxa Lucilie* or glory-of-the-snow, as we now call it, closely resembles these scillas, but its spike is longer, looser and more flowered, and the blue flowers have white centers. But while it is excellent for pots and frames and choice warm spots out of doors it is not nearly as rugged a plant as the scillas.

The spring meadow saffron (*Bulbocodium vernum*) blooms about as early as do the crocuses, is not unlike them and has rose-purple flowers. It likes partial shade—especially in early summer.

The spring snowflake (*Leucojum vernum*) is a little gem with nodding white green-tipped flowers that come in a little later and stay a little longer than the snowdrops. Although not very common it is very desirable.

Iris reticulata and its variety *Krelagii* are the earliest of their family and bloom at the same time as do the crocuses. They are perfectly hardy, neat, 8 to 12

EASTER is at hand.

THIRTY-TWO PAGES this issue.

THE TERRIBLE CYCLONE which swept over Louisville, Ky., March 27, undoubtedly played havoc with glass structures there.

OUR ANNUAL REPORT of the Easter trade will appear in next issue. Send in a report from your city, and mail it on the 7th inst.

REPORTS indicate that at nearly all points trade during Lent has averaged better than in previous years. This is a decidedly encouraging change.

inches high, and their blossoms are deliciously fragrant and colored violet, purple and gold. Perhaps *Iris Kolpakowskiana* may lay claim to equal earliness, but certainly not to equal loveliness. *Iris Persica* is also a very early one and with beautiful showy flowers, but it likes a warm corner.

Among early flowering anemones the hepatics take the lead. They love partial shade in summer. The double flowered varieties are gems in their way but scarce and hard to handle. *Anemone blanda*, a handsome blue flowering species from the Apennines should be grown in patches, for it is a beauty. The European pasque flower (*A. Pulsatilla*) comes in about the middle of April and will thrive in the open border. The coronaria and fulgens anemones although so gay and pretty are not always reliably hardy, that is hardy enough to grow and bloom vigorously year after year. Wood anemones come later.

The Rocky Mountain yellow *Erythronium* (*E. grandiflorum*) comes into bloom early in April, and is the finest species of all. It is soon succeeded by the different varieties of the European Dog's tooth violet (*E. Dens-canis*), and about the end of April or first of May in comes our common adder's tongue (*E. Americanum*). All love moist, rich ground with an open surface and partial shade.

Fritillaria pudica is a little yellow flowering beauty from the Rocky Mountains and one of our earliest spring flowers, coming in as it does in the second week of April. Crown imperial, guinea-hen flowers, and the other species common in gardens do not bloom till about the end of April.

The several species and varieties of narcissus beginning with the forms of *N. bicolor* or pseudo-narcissus, and also including *N. odoratus*, *N. Jonquilla* and the *N. poeticus*. If grown in good ground partially shaded in summer they will improve and multiply. Jonquils require a warm aspect. It often happens that several kinds of narcissus start to grow in fall and consequently get injured in winter, but this can be overcome to a large extent by lifting the bulbs in summer after they have completed their growth and not planting them again till the end of October.

Spring adonis (*Adonis vernalis*) has very large bright yellow flowers that open in the day time and close at night, and it is one of the gayest of spring flowers. A most desirable plant thriving in any ordinary border, and it is long-lived but slow to increase. *Adonis Pyrenaica* is another and very fine species in the same style.

Violets. *Viola odorata* in its several forms, single and double, is earlier than any of our wild species. The plain species and its white variety soon naturalize themselves in moist, faintly shaded places, and I have had them do so too on warm sunny banks. The Czar violet is hardly here, but the Neapolitan is barely so. Pansies with shelter do fairly well. But bedding violas and pansies can only be had in their finest estate when wintered under glass. *Viola rotundifolia* is one of our best earlies, then later come *blanda*, *lancifolia*, *Patrinii*, *rostrata*, *pubescens*, *canadensis*, *sagittata*, and many others that are hardly worth cultivating. But some forms of our common *V. cucullata*, notably the white flowered and variegated flowered forms are well worth growing, and they will grow most anywhere. And the only drawback to *V. pedata* is its commonness. *Viola cornuta*, both white and blue, grow and bloom well as common garden plants.

The common periwinkle (*Vincetoxicum* or "myrtle" as it is often called blossoms very prettily in early spring and keeps in bloom for a long time. Its use for shady places, also for planting in cemeteries is well known to every florist. *Vincetoxicum* is another and far more copious blooming hardy species, but not being evergreen it is not nearly so good as the common minor for the florist. *Vincetoxicum* major, the one we use so much of as a vine for vases, is not quite hardy with us.

Arabis albidula, the white rock cress, becomes a sheet of snow about the middle of April. It is a very desirable plant easily raised from seed or increased by division, and of dense, flat, spreading habit and very hardy, and likes an open place all the year round. The bloodroot, *Sanguinaria Canadensis* also comes in about the 10th or 16th of April and is one of our most welcome spring beauties, but it is of brief duration. It loves good moist ground with a loose surface and thin shade from scorching sunshine in summer. Aside from spreading at the root it increases a good deal by self sowing.

Omphalodes verna, the creeping forget-me-not, is a little spreading plant with bright blue flowers, and very pretty for a somewhat moist half shady place. It keeps green all summer and should never be grown in poor, dry or exposed places; it loves shade from warm sunshine.

Glen Cove, N. Y. Wm. FALCONER.

New York Notes and Comments.

W. C. Wilson's nurseries are now to be carried on by a company recently organized. The place is to be known as Astoria Nurseries. The intention is to carry a large stock of palms, ferns and florists' stuff generally, as well as nursery stock.

The smart (?) nurseryman who formerly sold an old and familiar bedding plant as a novelty under the title of "Rainbow Plant" is coming to the fore again; among his novelties this year is the "Rainbow Cactus" (*Echinocereus caudatus*). It is described as a beautiful, rare and costly cactus, a most beautiful plant at all times, but unsurpassed in grandeur when in flower. Another novelty offered by the same man is the "new perpetual blooming hardy climbing white rose, Mary Washington," whereof a pretty little romance is related about its culture by Washington at Mount Vernon, where it originated, and where it has grown pure all these years, until this enterprising florist had an opportunity to spring it on an unsuspecting public.

Another plant advertised in various domestic publications is the "Orchid Water Lily." Such a combination title is rather a stunner; the thought of a cross between an orchid and a water lily is enough to make the shade of Asa Gray revisit the realms of earth. However, the advertiser is kind enough to tell us that the "Orchid Water Lily" is a rare pontederia, with lovely orchid-like flowers (in italics). From the description given it is presumably *P. crassipes*, which is really a most interesting plant, well worth growing. It deserves the praise given it in the advertisement, but such an abominably misleading and incorrect name as "Orchid Water Lily" ought not to be allowed. Why, it is not even a water lily, and when one adds insult to injury by tacking on the name "Orchid" in addition, it is enough to make the abused plant curl right up and die on the spot. The committee on nomenclature could have a good deal of fun studying the floral advertisements in domestic papers which have their largest circula-

tion in remote rural districts. Advertisers of remarkable novelties usually put in their best efforts on these papers. It may show smartness to persuade people to buy old truck under high sounding names, but I doubt whether it does the business any good in the long run. That pontederia is no doubt a pretty and easily grown plant, but it has no right to go about in a mask and domino as the "Orchid Water Lily." As for the "Rainbow Cactus" man, his advertising cuts and descriptions bear about the same relation to the plants they represent as the posters outside a dime museum do to the freaks within.

On a recent visit to the Rose Hill Nurseries at New Rochelle, a number of orchids were in bloom, though a large proportion of the flowers were used at the recent show. A very fine batch of *Odontoglossum vexillarium* was just coming into bloom; strong plants, showing a profusion of spikes. An exquisite little *epidendrum* noted was *E. bicoloratum*; the flowers were pure white with a few crimson spots in the center of the lip. It is said to be rather difficult to flower; Mr. Siebrecht considers its chief desideratum to be plenty of light, as well as heat and moisture; it should be grown up near the glass. This plant is also known as *Diarrhiza bicoloratum*.

Quite an odd little freak in *Cypripedium bellatulum* was a flower having three little projecting horns on the lower part of the pouch. One of the most fragrant orchids in bloom was the little *Erides japonicum*; it is a cool house species, bearing a little raceme of white flowers marked with pale purple. A most beautiful white orchid was *Dendrobium Dearei*; it produces both terminal and lateral racemes of handsome pure white flowers; the only color is a green tinge in the throat. The flowers last several weeks in perfection; it is certainly one of the handsomest dendrobies.

In the rose houses some very fine Puritans were to be seen. When we see a perfect Puritan we can not wonder at the praise it received, but it is one of those roses which would only pay a man who handles his own stuff. Some fine *Gontiers* were observed in a cool house. Mr. Siebrecht is of the opinion that this is essentially a cool house rose, coming nearest perfection in the same temperature as carnations. The house here noted runs about 50°, and the plants not only keep clean, but are entirely free from any tendency to drop their leaves, which appears to be the greatest fault the plant possesses.

Rose Hill is likely to produce some very fine hybrid *amaryllis*; crosses are now being made between *Empress of India* and other showy varieties. These plants ought to be of decided value in the trade; they are exceedingly showy and highly effective in decoration.

A stove shrub which is recommended for sub-tropical bedding is *Phyllanthus rosea picta*, it is graceful in habit, covered with a profusion of ovate leaves, crimson tinted. It would show up well in a group of light colored crotons.

One of the coming additions at Rose Hill is a lily pond, where *Victoria regia*, Egyptian lotus and other handsome aquatics are to be grown. Another branch to be extended is that of herbaceous stuff, which seems to be increasing in demand. By the way, a thing in this line useful to the florist is the fine-leaved paeony, *P. tenuifolia*; it is very vivid in color and may be forced by Easter. A lot of the finer sorts of paeonies have been found useful in the cut flower trade.

SUMMER DECORATION AT GREENHOUSES OF MR. GEO. CLASSMANN, SING SING, N. Y.

A very fine specimen cycad, recently imported from Potsdam, was *Encephalartos Altensteinii*, a large and handsome plant of a rare variety, it is closely allied to the *zamia*s.

Apropos of late chrysanthemums, Mr. Siebrecht cut some blooms of Mrs. Hardy on St. Patrick's Day; there is something lingering about that.

We can't tell just yet how Easter stuff is going to turn out, but it looks as if a good deal of it would be much too late. The miserably dull or rainy weather has put everything back; a great many of the *hydrangeas* seem likely to be late. Thos. Hogg seems generally more advanced than Otaksa, and for the last few years the latter has held the preference. Without continuous sunshine for the last two weeks of Lent a good many of the flowers will fail to be on hand, and this will entail a considerable loss.

EMILY LOUISE TAPLIN.

Summer Decoration.

Considerable has been said in the *FLORIST* regarding the decoration of florists' grounds in summer, and in connection therewith we present an engraving reproduced from a photograph of a portion of the grounds of Mr. Geo. Classmann, a florist at Sing Sing, N. Y., taken during the summer of 1889.

Mr. Classmann writes: "You would be surprised to see the number of visitors coming to see my flower garden during the summer months, and what a financial effect it has on my business."

We are not surprised at the effect noted. We should be surprised did not the care and time expended pay for itself many times over. You florists whose grounds are devoid of any decoration immediately adjoining the greenhouses, except piles of pots, old boxes and rubbish, take a look

at the accompanying illustration and go and do likewise. Put your best, not your worst, side out; and begin this spring.

The March Cold Snap.

Up till the first of March we had the most open winter of my remembrance; trees and shrubs were nudely forward and there was no frost in the ground. But with the advent of March the day of reckoning came and winter appeared in a snowstorm and searing frosty winds and the temperature fell as low as 10° Fah. *Prunus Maackii* and *Spiraea sorbifolia*, always in a hurry, were bursting into leaf, but now their young growths hang upon them like blackened rags. *Jasminum nudiflorum* was just out of bloom and escaped unburnt. *Hamamelis Japonica*, painted in gold since the middle of January, had every blossom killed, but as *Corylopsis pauciflora* and *Cornus Mas* had barely burst into bloom both have escaped. The Japanese vine honeysuckles kept evergreen all winter and the variety Heckrottii in bloom, but now its flower buds have been destroyed. The soft maples (*Acer dasycarpum*) were in full flower, but the sudden frosts have killed the blossoms. The mezeon was in bloom but its flowers have escaped wonderfully. Among bush honeysuckles *Lonicera Standishii* has been in bloom since December and *L. fragrantissima* since January, and under ordinary circumstances both would have lasted till the end of April, but their flowers are completely blackened. *Prunus angustifolia* was headed all over with flower buds swollen almost ready to burst, but are now ruined. *P. tomentosa* was still more advanced, for several buds had burst, and the double flowering *P. myrobolana* was in full flower, but now both buds and blossoms of all are blasted.

Some *andromedas* were in bloom, but they don't seem to have suffered at all, neither has *Rhododendron Dahuricum*. Many of the Japan quinces, scarlet, pink and white, were in partial bloom, but now all flowers that were open, also bursting buds, have been blackened. The extent of the damage done to yews and hazels I am yet unable to determine; some flowers seem sound enough and others are damaged.

At the same time in general health I don't think I ever saw trees and shrubs, deciduous or evergreen, at this time of the year, look better than they do now. Among hardy herbaceous plants everything seems to have wintered well, even *Montbretia crocosmiflora*, unprotected in any way, is perfectly sound. The southern form of moss pink (*Phlox subulata*) has been blooming a little for over a month, and the white arabis is becoming quite a snowy patch. And a greater number of fall-sown annuals have survived the winter than is usual. *Eschscholtzia Californica*, for instance, is just as fresh and plump as a brown coreopsis. And bulbous plants have come into bloom a little earlier than they do in ordinary seasons. Crocuses, snowdrops and winter aconites have been in bloom for some weeks; Siberian squills are now in, some of the trumpet narcissus are in bloom, but not nearly a full crop yet. Roman hyacinths were about bursting in flower when the searing winds overtook them and scorched their tops.

Glen Cove, N. Y. WM. FALCONER.

OUR NEW DIRECTORY of the florists, nurserymen and seedsmen of the United States and Canada is now ready. Price \$2.

TO GIVE THE *FLORIST* your fullest support, confine your orders as far as possible to those who advertise in its columns.

Long Island Notes.

BY A. E. WHITTLE.

Specialists in any profession or business are sure, at any given time, to be conversant with the latest facts pertaining to the particular profession or business. Therefore, if one would know the latest opinions concerning any enterprise of interest, it is to the specialist that attention is directed in order to obtain whatever information is needed.

Among the specialists in rose growing within the vicinity of New York, not any are of more general reputation than Mr. Chas. Anderson, of the John Henderson Co., Flushing, Long Island, and Mr. John Taylor, Bayside, Long Island. These two gentlemen live and each carries on his extensive business only a few miles from each other, and a visit can easily be made to both places in one day.

It is but natural that we should find with all specialists certain general characteristics, and these characteristics are always an earnest attention to details and unceasing vigilant observation. And these features of successful enterprise which all specialists are sure to manifest, are plainly portrayed at the two places under consideration. If here we find roses well grown we may be sure that the general welfare is obtainable only by careful and persistent labor. The methods used are apparent to all who have an eye to cause and effect. Plainly demonstrating that the only secret to success is daily and hourly care.

How often have we found men who are well versed in the principles of the art of growing plants. They can tell you the why and the wherefore of much that we wish to know concerning the conditions underlying successful plant growing. Men who in their youth had a thorough training in both theory and practice, yet who, strange to say, never have their places up to a standard of excellence. The fault does not come from lack of knowledge, but from lack of attention to detail. Each day but impresses this fact more upon close observers. Excellence can only be obtained by leaving undone no minor detail. Anticipate disease and weakness by care and watchfulness, is the golden rule of the maximum of success in plant growing.

Here in these two places this care is evident by the absence of all decaying leaves upon the beds and the plants, no mildew or greenfly allowed to obtain a permanent foothold, thus sapping the life from the plants, no useless blind wood unpruned taking the nourishment that should go to the formation of bloom, no litter in the paths, and no litter under the benches; all in order and system apparent everywhere.

To visit such places is always a pleasure to the student and enthusiastic worker. No matter how hard the times there expenses at any rate are sure to be met. No man ever yet succeeded in making a place pay by allowing any necessary work to go undone from a mistaken idea of economy. It is not in our labor bill that we should ever retrench when we have only the necessary hands to do the

necessary work. We may always be sure that when a place is seen where all the work has received attention just when it was needed, that here no false idea of economy in labor is practiced. Frequently it is noticed that a batch of plants is grown in health to a certain stage, and then because some essential work in tying, potting, etc. is postponed from inability to accomplish it on account of deficient labor, the plants ultimately become only fit for the rubbish heap and all the previous labor is thrown away.

Mr. Taylor at his establishment, besides roses, grows carnations, cypripediums, chrysanthemums and a few violets. The houses are not new—some of them being quite old—and, therefore, excellence of product is all the more creditable. The method of heating is by steam, and like all those who have a relatively perfect system of this mode of heating, Mr. Taylor is quite satisfied with its practical adaptability to the end desired.

The tea roses grown by Mr. Taylor and upon which he depends principally for his crops, are Catherine Mermet, Mme. de Watteville, Mme. Cusin, Perle, Papa and Bride. These roses were all in the most promising condition. Not many flowers at this time, as the plants were generally off crop, but good breaks could be seen everywhere, indicative of large crops later on. Contrary to the prevailing experience, deformed Perles have not been so plentiful this season at this place as heretofore.

Among the newer teas Mr. Taylor gives Mme. Hoste a high place. And so far as personal experience goes, this rose deserves the commendation he bestowed upon it. Its one fault in winter is variability in quality. Upon the same plant and at the same time can be found flowers the size of an average Cook, and some no larger than good Safranons. The only way to obtain a constant high standard is to pick off all buds that only promise small flowers. Another objection could possibly be made, and that is, the rose is a persistent cropper, at one time covered with flowers, then for a period not any whatever to be seen. It is a free grower, not subject to mildew, and susceptible to stimulation. As a summer rose inside it is of no value. Its merit as a summer outdoor rose is not known to the writer.

Meteor also is a favorite with this gentleman, and he intends growing it somewhat largely for next winter. The flower is not at all small and the color is very rich and effective. Seemingly a free bloomer and responding quickly to careful treatment. Probably the best of the continuously blooming red roses. To judge from a cursory view, this rose promises to supply a long felt want.

Princess de Sagan, another red rose, has been tested also within these greenhouses. The writer too has an experimental knowledge of this rose. The size of its flower is its great fault. Very free blooming, exquisite and constant in its coloring, yet the flower is so small that any brisk demand can never be expected for it. For any one who wishes a red rose that can be sold cheap, this is the rose.

Some houses of fine hybrids are also to be seen. One house of Magna Charta was conspicuous for its uniform appearance, and was just coming into bloom at the end of February. These plants at this time were just one year from the cutting; grown outside through the summer and lifted in November, then planted in boxes made for the purpose from 10-inch spruce or hemlock boards. These boards are ripped through the center and are

made into boxes 12 inches wide and four feet long. Two of these 5-inch boards for the bottom with an inch space between them for drainage and one board for each of the sides. These boxes can be placed together, thus saving much room which pots necessarily take up. Mr. Taylor stated that most of these roses averaged five flowers to each plant. If this computation is correct then these hybrids produced a handsome return upon the outlay.

The carnations principally grown here are Silver Spray, for white, one highly recommended; Portia, for red; Orient, for crimson, and Hinsdale, for pink. The latter variety has been generally discarded by other growers, for though it is free flowering the ragged appearance of the flower, owing to the bursting of the calyx, is not a desirable feature. In one house of carnations, gladioli are planted between the rows. These look very promising and no doubt there will be plenty of flowers for Easter. The varieties grown for the purpose are Shakespear, John Bull, Isaac Buchanan and Brencleyensis.

The greenhouses belonging to the John Henderson Co., under the management of one of the proprietors, Mr. Chas. Anderson, are also many of the old style. Some few of late erection. But an apt remark was made by this gentleman. That it is comparatively easy to grow roses at a new place and in new houses. That the plants thrive with the minimum of care in new soil, new houses and a new locality. And that many who commence in this way and succeed in growing roses fairly well, fancy themselves expert cultivators, only in a few years to be confronted with conditions of growth that perplex them to the utmost, and unless there is a thoughtful and observant man to control these conditions, failure will often result. All such conditions as decaying vegetation, wood and soil filled with the eggs and larvae of insects that prey upon plants, benches rotting and fungi spreading, are the necessary features of old houses, and it will certainly require more skill to produce good results with such an environment than when the surroundings are more freed from the germs of disease.

It hardly appears possible that there can be better hybrid roses than Mr. Anderson has in his houses. They can only be described as magnificent. One large house was full of Ulrich Brunner and some others in bloom, and finer flowers and cleaner foliage it would be hard to find. And one surprising statement—at least surprising to the writer—was made. For it was said not one of these hybrids that was in flower was on the place at the first of January of this same year. And yet in bloom by the end of February. Potted, started and in bloom within two months seems hardly credible. Some of us to do the like would have to materially revise existing methods.

Several other houses of hybrids, in different stages of growth, attest the remarkable proficiency attained. Where nothing but praise can be said any other comment is superfluous.

Among the teas several benches are grown of Mme. Falcot. This rose though rather small, is desirable for its free flowering quality. Coming in very handy for those who need a rose that can be sold at a low price. The plants were covered with buds and flowers, and all in fine condition.

Some Cooks are still grown here, and Mr. Anderson retains an enthusiasm for its merits. When well done what rose can surpass it? But the trouble is to

ROMNEYA COULTERI.

grow it well and to grow it at a profit. The Bride has supplanted it, because it can be easier handled and good flowers are usually to be depended upon. But when good Cooks are seen admiration must always be excited, and it is pleasant to find some of the good growers who still retain it in their houses.

Souvenir d'un Ami, another rose some discard, but still here retained. So many flowers can be cut from a given space that it is a profitable rose to grow. It is a rose that will succeed fairly well with less attention than many others. Houses of Perles, Papas, Mermets, etc., all in fine condition and ready to produce fincrops through the coming spring months. Niphotos was the only rose in poor condition, and the reason is a mystery to Mr. Anderson. This again proving that to the most experienced, problems in growth, sometimes beyond solution, are often met with.

A very fine lot of La France; fine flowers and free from black spot. Mr. Anderson thinks that Duchess of Albany is desirable and will occupy a place by itself and will not supersede La France, one rose being in as much demand as the other.

In neither of these places are Bennets or Beauties grown. The place is yet to be found where every rose will succeed.

Mr. Anderson has great expectations

of the climbing Perle that he has lately introduced. It is a strong grower and just as free flowering as the other Perle we all know so well, and wherever a climbing rose can be grown to advantage this rose should have a place.

Albany, N. Y., March 5.

Romneya Coulteri.

This charming flowering shrub deserves to be brought to the notice of florists. It belongs to the poppy family of plants, and has roots and foliage similar to those of the boconia. It attains a height of 6 to 8 feet and one of these plants in full bloom is a magnificent sight. For cut flowers it is unsurpassed. It delights in a loose mellow soil and is of easy cultivation. In its wild state it blooms during the months of June and July, but under cultivation the flowers follow each other through the whole summer. Whether adaptable for forcing remains to the experimental faculty of one of our brother florists. The flowers of the romneya are of a pure luscious white, on which the yellow stamens lie like a golden crown. At first sight it reminds one of a single white peonia, but delicate in build it lends itself with more grace to floral designs. The seed is slow to germinate lying in the ground sometimes for six to eight months, but the plant is easily propagated from

root division or cuttings. This plant attracted the attention of English horticulturists some years ago and two colored pictures of it have appeared in the *London Garden*. We in the United States should not be backward in availing ourselves of all the beauties of our native flora. The accompanying picture is a photograph taken from a branch which had, however, been allowed to fade slightly before being subjected to the camera. Try the romneya and you will be satisfied that we need not go to foreign countries for floral novelties.

H. H. BERGER.
San Francisco, Cal., Feb. 21, 1890.

Romneya Coulteri was one of the leading novelties last year among flower seeds; and seedsmen, both here and in Europe, are again pushing it this year. But notwithstanding its marvelous beauty in California, and elsewhere where it is hardy and thrives well, it is not likely that it will become a popular plant with florists in the northern and eastern states, because it is not hardy in these states. It can be wintered safely, however, in a cold pit, for it will bear a good many degrees of frost with impunity. It is eminently a summer-blooming plant, and an eastern grower who has cultivated it for a dozen years reports that while old plants bloom freely in summer they show no disposition to bloom in winter even when ripened early, rested, and then gradually introduced to warm quarters. It is a lovely flower, however, and highly deserves the attention of amateurs and plant lovers generally. The same eastern grower also informs us that fresh seeds germinate with him in four to six weeks' time after sowing. There is a note about this beautiful flower in the *FLORIST*, March 1, 1889, page 330.

W. F.

New Plants Again.

In a lengthy article in the *FLORIST* of February 15, Mr. Whittle effervesces on enterprise in general and particularly so in the florist business. He especially emphasizes the fact that only by enterprise can a man hope to succeed, and proceeds to say that one may make many attempts yet also many failures. He farther states that the idea prevails that expenditure is enterprise. That may have been Mr. Whittle's experience, and we may so infer from his doleful lament over that grand chrysanthemum Mrs. A. Carnegie. He must be a very bold man indeed that would affirm that the above chrysanthemum was not an acquisition to the varieties then in cultivation. If Mr. Whittle was so enterprising as to spend \$2 for a plant of this variety and failed in growing it, that is no reason why he should publicly denounce it; others have made a success of growing it, and I have no doubt but that the disseminator of it also made money, and that it will continue to be grown as an acquisition to the varieties then in cultivation.

Mr. Whittle would make me say that I favor indiscriminate purchase of new plants. This may have been the method pursued by him, and for that reason called down his ire on new plants. But I can assure him with all confidence that new plants will continue to be purchased (and with discrimination), and that there will be money made on them. He farther states that many of us have neither the time nor the money, etc. I am sorry for him and would again advise him to let the new plants alone, and as I said before, let his more enterprising brethren reap the benefit of their time and money spent in visiting exhibitions, and growers of new plants, where I can assure Mr.

Whittle they are not hid under a bushel, but open to criticism and discrimination. I don't believe there will be any distinction made by the raiser of new plants to the florist doing a catalogue business and those who do not, his goods are in the market for sale and I believe it is quite immaterial to him whether the buyer does a catalogue business or not providing he can supply the cash wherewith to pay.

It is decidedly unfair to cry down any particular plant because we are not in a position to make money on it. It may have a value far above a profitable flower producing plant and fill a place in horticulture as acceptably and as profitably (to some) as a plant that will pay as a flower producer. I will freely admit that there are a great many new plants sent out that are nothing short of rubbish and they who buy indiscriminately and also they who make a practice of selling them knowing them to be rubbish ought sooner or later to reach the end of their purse even if it should prove to be a long one.

JOHN DALLAS.

Fairfield, Conn.

Cut Flowers.

But a few years ago the main object in gathering collections of orchids for commercial purposes was for the sale of the plants. The sale of the flowers was of secondary importance. In fact, but few of the retail florists ever dreamed of using these beautiful flowers in their work, and as for the commission men, no orchid flower was ever seen upon their counters.

At the present time there are still many who are dubious as to the ultimate success of the business of growing and selling orchid flowers. No doubt, in many of the smaller cities, the demand for orchid flowers is still very insignificant. Naturally so. People move in crowds, and until the fact is known that orchids are generally used by society in the great cities, this demand will be of no moment. But time will remedy all this, and the day will soon be here when every florist may expect to use these flowers in some of his orders.

As proof that this business is experiencing a marked increase the evidence may be cited of the number of collections of orchids where the flowers have a decided commercial value. Only last fall Mr. Manda informed the writer that every orchid flower he could send to New York found a purchaser. Mr. Siebrecht says the same, stating that not an orchid flower from his large collection is ever wasted. Others make the same statement, and we can but accept it as based upon verified experience.

Formerly no orchids were seen in florists' windows. Now it is the exception to see one without some temptingly displayed. Not only displayed, but if one enters inside he will see them used. Used for bridal and corsage bouquets, mantel and table decoration. The artistic part of the florist's business has within the last three or four years experienced a great impetus, and it is the part of the wise man to observe and profit by the signs of the times.

No one fact concerning the extent of orchid cultivation is more surprising than

the immense quantity of the flowers of *Cypripedium* insigne that are now grown and sold. Why this flower more than other orchid flowers? It is far from being the most beautiful. The reason is to be found solely in its comparative cheapness. It is easily grown, quickly propagated and flowers freely. This teaches us that when many other orchids can be increased materially in quantity and the flowers of the same consequently lowered in price, that they also will be used in like abundance.

It is gratifying to most of us to find that this is so. We would have the public appreciate and love other flowers than roses, violets and carnations. Not that any one would or can supersede these necessities. But let us do all we can to increase the variety. Not to be content with continual travel in one groove.

These thoughts were somewhat strengthened by a visit to Messrs. Siebrecht & Wadley's fourth annual orchid show. Perhaps it is safe to assert that the increased demand in New York for orchids is in a great measure due to the education and influence this annual show has exerted upon the citizens of that city. Some may smile at the supposition that this exhibition has an educational tendency, and will claim that it is purely a business enterprise, created and sustained entirely for the object of making money. Undoubtedly this is the purpose. Any other aim in a business firm would be Quixotic. But though the direct tendency is the extension of one firm's business, yet the indirect tendency if the enterprise is successfully conducted must be for the benefit of all engaged in orchid growing for commercial purposes. Of the many thousands who view the exhibition each year that it is held a proportion is sure to have awakened within them some admiration for orchids, an admiration which in many traceable cases is sure to create a desire to buy and possess, and it must indeed be a very narrow view that would suppose all these future purchasers can only benefit one particular firm. This exhibition, held this year from February 19 to February 28, may be again regarded as a success. Larger crowds than ever were in attendance and surprise is felt that these orchid exhibitions should succeed so well and so many other exhibitions in New York, of chrysanthemums, etc., should so lamentably fail.

A. E. WHITLEY.

Books on Landscape Gardening.

The Literature of Landscape Gardening is a larger one than most people suppose, and the best books on the subject are undoubtedly those which were written about the end of the last century and the beginning of this. I refer to such works as Uvedale Price's "Essay on the Picturesque," Knight's "Landscape" and Gilpin's well known "Picturesque Tours," all of which aim at making the study of nature the true and only method to be employed by those who would be landscape gardeners. Walpole's "Essay on Modern Gardening," Whately's "Observations," and the several comprehensive works of Repton and of Loudon all treat of the subject in the same manner, but of modern English books, there are few of great value. In America, however, the late Mr. Downing wrote several of importance, and such writers as Olmsted, Scott, Cleveland, Copeland, and a few others have all contributed something to our knowledge of the subject.

I append a list of the more noteworthy books which have been published in England and America, and also those

French and German works which I consider to be the most important.

Chicago Notes and Comments.

BY EDGAR SANDERS.

Calling the other day at the new greenhouse plant of J. C. Vaughan, started last year at a place called Western Springs, a few miles out on the C. B. & Q. railway, I was greatly struck with the way Tidal Wave carnation was flowering, and its apparent usefulness for the cut flower man. There were about seven or eight hundred plants set out on benches in the ordinary way. But had been cut all to pieces the entire winter whenever a cutting could be got hold of to make a new plant of. Now, thinks I to myself, here is a great change from most carnation houses at this particular time of the year. Here we have a case with no grass and abundance of flowers, while in most cases it is all grass and not flowers enough to pay the fringe. Would it not pay to keep the shoots thinned out early in the season where they are found to grow too much to blind shoots? The healthy character of the great green blooming flower stalks in this particular case must also have assisted the plants in their efforts to prolong life by new shoots (cuttings), else the severe knifing would have exhausted the plants, which did not seem the case by their vigor. It looks as though Tidal Wave is to have a run.

The new rose, a mixture of the blood of the tea and polyantha, Clotilde Soupert, looks charming with its clear cut almost formal shape and singular character of bearing pure pearly white flowers, again others with a charming rosy pink tint, shading down to a silvery white and all on the same stem. Although not so crowded as the polyantha class, there are from three to ten buds on a shoot, are of a goodly size and if not destined to become a fashionable cut flower it is surely fine for amateurs and summer growth. For out of door culture in the south it ought to be a beauty.

There were good flowers of Wootton, also of the Malmaison sport Princess Victoria—what a great rose she is. The red La France—Duchess of Albany, like the rest, managed to flower finely in spite of the cutting fiend.

Gardeners' Magazine in Milwaukee in 1838. In looking through an old "Farmers' Register" published at Petersburg, Virginia, in 1838, I came across the following: "We received lately the first number of a new agricultural paper, published at the unheard-of town of Milwaukee, which is further northwest (as it would seem from the title) than the art of spelling has yet traveled. It is called the *Wisconsin Cultivist and Gardeners' Magazine*." The editor copied a price-current it contained for April 17 as a curiosity and to show the high prices prevailing in the ambitious young town. The best flour being from \$10 to \$12 per barrel, other things in proportion. The paper was small quarto, monthly at \$1. Are there any copies of this western ambitious gardeners' magazine extant we wonder?

Another extract to show what this town was about these times. The *Green Bay Intelligencer and Democrat* of Sep-

tember 1835 says: "The Milwaukee, a correspondent at the mouth of the Milwaukee speaks of their having a town already laid out; of selling quarter acre lots for five and six hundred dollars; and says that by fall there will be one hundred buildings up, that some fifty people are living there." The year 1836 seems to be the starting year for the town, two years before the issuance of the paper in question.

Boston Notes.

Crocuses in full bloom March 15.

The representatives of the Boston Club who attended the Philadelphia Club's supper, came home much pleased with their trip.

A delegation from the Mass. Hort. Society visited the greenhouses of R. M. Pratt, Esq., on Thursday March 20, to see the orchids. Mr. Allan has good reason to feel proud of his success this year. The show of dendrobiums is especially rich and has never been equaled here.

One of our most widely known and much respected florists was reported to have died suddenly in the railroad station a few days ago. Telegrams of condolence were sent to his house out of town, arrangements were made to have flowers sent to the funeral, and other evidences of sorrow at the unwelcome news were plenty, when it transpired that the whole affair was an idiotic attempt at a "practical joke." It is difficult to conceive of the heartless cruelty that will permit a man to carry his disregard of humanity to such an extent, or the vacancy of mind which allows him to find pleasure in such a contemptible deception. Surely no one envies him his present position.

W. J. S.

Notes on Seed Novelties.

BY WM. PALCONER.

AQUILEGIA CHRYSANTHA ALBA.—A white-flowered form of our Colorado mountain golden columbine, and, no doubt, a desideratum. But we cannot reasonably expect that all of the seedlings will have white flowers. The typical or golden form is one of the boldest and best of the genus, a splendid garden plant, and the latest blooming of all the columbines that are in cultivation. Its spurs are always long.

AQUILEGIA STUARTI.—is a hybrid between Grigor's form of *A. glandulosa* and the Caucasian *A. Wittmanni*, and partakes strongly of the *glandulosa* nature. But it is stronger and has larger flowers and more of them.

ARNEBIA CORNUTA.—One of Dr. Regel's recent discoveries in Central Asia, an annual, and a species that, I believe, has come to stay. It has long been known to botanists, however. And according to the *Gardener's Chronicle* it is found in Siberia, South Eastern Russia, Algeria and Tunis. Mr. Charles A. Dana, when in Germany three years ago saw it in perfection in Max Leichtlin's garden, Baden-Baden, and was delighted with it and brought me home a glowing account of it. When so critical a judge is captivated by a little annual, I am convinced it has pronounced merit. The blossoms are yellow and each one when it opens has five large black spots upon its face; day after day these spots lessen in intensity till the third day when they disappear altogether and the blossom is simply yellow. This may seem, to many, as incredible, but the same peculiarity may be seen in *Arnebia echioides*, a perennial species, for many years a common inmate of our gardens. Only 12 seeds in a packet. *Arnebia Griffithi*, another annual species, from North Western India, of somewhat similar type has been grown in English gardens, but, probably, is not now.

CHIRYSANTHEMUM MULTICAULE.—A little daisy-like annual with golden yellow flowers. A native of South Africa. The seed packets are generously filled and the seeds germinate freely.

CENTAUREA CYANUS fl. pl. or double-flowered corn flower. It is double, or semi-double rather, in the same way as is *Gaillardia Lorenziana*. The seed is good; ours germinated just as well as did those of the common form.

CERATOTHECA TRILOBA.—An annual bignonia from Natal. Grows 6 to 7 ft. high, has trifoliate leaves, axillary clusters of large bluish-purple flowers and martynia-like seed vessels.

CEPHALANDRA PALMATA.—A luxuriant vine from South Africa, with large palmate leaves, reddish orange flowers and carmine cucumber-like fruit.

CYCLOLOMA PLATYPHYLLUM (not "*Cyclotoma platyphylla*" as it appears in the seed list).—This is the Great Cyclone plant of the Black Hills." That may be so, at the same time it is only an annual weed commonly known as Winged Pigweed and according to the "*Botany of the Rocky Mountains*." It is found "from Colorado to the head waters of the Missouri and eastward to the Mississippi."

DELPHINIUM BRUNOXIANUM.—A plant that pops up every now and again as a novelty, and I don't think it has come to stay this time either. It is a dwarf, pale blue, musk-scented species from the high Himalayas.

GLOXINIA "DEFIANCE".—An erect flow-

ered variety and said to have blooms "of an intense, glowing, crimson-scarlet" color. This may be all right, but when we are told that it "for richness exceeds anything hitherto found in the genus" we had better sow some seed of it and find out. If it is finer than Veitch's, Suttons' and the other crack strains that we grow it must be marvelous. Two of our American firms have made specialties of gloxinias this year and issued colored plates of them: one of these plates is very poor, the other very middling, and neither anything like as good as their gloxinias, which I have seen in bloom. Dreer too has made a feature of gloxinias for several years.

DODECATELON CLEVELANDI.—A species (or variety?) recently discovered in southern California and named for Mr.

ARNEBIA CORNUTA.

D. Cleveland of San Diego. Where found wild it grows in great abundance, blooms in spring, and its flowers run from white to rose pink and purple. Large quantities of its seed must have been gathered and distributed for it is offered in most every catalogue, European as well as American. The seeds germinate readily, however, for ours have come up nicely in about 15 days. It is hard to tell which of the western forms of *dodecatheon* are good species. Dr. Gray undertook it once, see *Botanical Gazette*, XI, page 231, and Mr. E. L. Greene has done it since, in 1888, with, of course, different results.

DIANTHUS CARYOPHYLLUS MARGARITE.—Popularly called Queen Margaret's Carnation and named in commemoration of Queen Margaret of Saxony, the consort of King Humbert. It is said to be a cross between the Indian pink and the double garden carnation, to bloom the first year from seed and to bear blossoms of several colors and which never burst their calyces. Certain it is that the seeds germinate freely, for ours have done so, and the young plants are growing vigorously.

GALACTIS TOMENTOSA.—A handsome prickly leaved, thistle-like plant from the Mediterranean regions; the leaves are spotted with white above and covered with cottony down on the underside. Grows about two feet high and has lilac-purple flower heads. If sown early it blooms the first year; if sown late few bloom. It has milky juice. It is an old plant in gardens, but, in its way, for fancy bedding it is superseded by chamæpeuce.

HELIANTHUS ARGOPHYLLUS TEXANUS (but why *Texanus*, when *H. argophyllus* itself is a Texas plant?)—Called the Texas "Silver Queen" sunflower, and said to be a marked improvement on the old *H. argophyllus*. It is an annual, 6 to 8 feet high, of pyramidal contour, branched from the ground up, and it has cottony leaves and young wood and medium sized single flowers. A handsome plant, but easily broken by wind and rain storms. The height here given is greater than that accorded to it in the seed list, but *H. argophyllus*, which I have grown from Texas seed for many years, has always grown over 6 feet high with me.

LATHYRUS SPLENDENS. "*The Pride of California*."—Serenio Watson in Bot. Cal. II, page 442, gives it as a form of *L. vestitus* "The common species of the southern part of the state (California), from Sonoma county to San Diego, on dry hills in the Coast Ranges; very variable." A perennial species with rose colored flowers. Of the common everlasting pea (*Lathyrus latifolius*) we also have a superior form called *splendens*.

MOMORDICA INVOLUCRATA.—A new species of the Balsam Apple Vine and indigenous to the Drakenberg Range, Natal. It is a perennial plant but probably not hardy; if the roots are lifted and wintered as we do other growing tubers, however, we may expect to save them over till the following spring.

MELOTHRIA PUNCTATA (*Zebuaria shavias*)—One of the ornamental cucumber vines, of vigorous growth and bearing multitudes of small fruits. A native of South Africa.

MYOSOTIDUM NOBILE, "New Giant Forget-me-not." A remarkably handsome Forget-me-not-like perennial from New Zealand, where it grows in damp sand by the seaside. It has several times before now been introduced to cultivation, but with poor success.

"**RUMEX ROSEUS**" is offered by Burpee. Said to be an annual with bright red flowers and showy green red-veined capsules and exceedingly ornamental. I do not know it. Now among the docks and sorrel one would hardly expect to get a very ornamental garden plant, but about a dozen years ago I used to grow *Rumex sagittifolius*, a climbing vine, that bore the greatest profusion of red capsules and which had a striking and beautiful effect. I would much like to get it again.

PRIMULA ROSEA is offered by some. It is a lovely little pink flower from the Himalayas, and has been in cultivation for ten or a dozen years. In its germinating qualities it has always behaved with me in the same way that *P. Japonica* does, namely, while freshly ripened seed grow freely I never could get seed kept over till spring to germinate. It may have acted differently with other people, though.

VIOLA CUCULLATA ALBA.—A splendid wild violet to let scatter itself in the border or rockwork and it blossoms in the greatest profusion in early spring, and self-sows itself all around. It is the white flowering form of our common swamp violet. But it isn't "ever-blooming," and although it has become a weed in our borders, I never knew it, under ordinary circumstances, to "bloom from October till May." On the contrary, the whole cucullata race are the most pronounced deciduous violets that we grow.

OSTROWSKIA MAGNIFICA appears in a good many catalogues, but I am informed that the seed crop failed.

CAMPANULA PUNCTATA.—A free-bloom-

THE WHITE TORENIA FOURNIERI.

ing and useful hardy perennial, white and easily gotten up from seed. But it has long been in cultivation and seed lists too.

ARGYREIA TILLOFOLIA, a perennial vine, a tropical convolvulus.

DATURA CILORANTHA, double flowering.—Has large, drooping, fragrant, yellow flowers. It is not a new plant at all either in gardens or seed lists, but well worth pushing again. Like several other of our finest daturas, it is a tender perennial, but as it flowers freely the first year from seed we usually treat it as an annual.

EUPHORBIA HETEROPHYLLA.—Last year it may be remembered, Mr. Goodell, of Dwight, Mass., "sent it out" in order to get ahead of his brethren, but he didn't have nearly enough stock of it. All have plenty, however, this year. It is nice enough in its way, rather coarse, not very showy, useless for cut flowers and may be somewhat disappointing. But the seed is good and germinates well.

ASTERS.—Among the China asters we have several claimants for attention, but the new white edged Triumph and the blue flowered Comet are the most striking. Speaking of asters, I may say that that field of Comet I saw at Vick's last August was the finest aster sight that I have ever seen. Every flower like an immense full-double Japanese pink chrysanthemum.

ECKFORD'S SWEET PEAS in packets come to us every year. I don't dispute their fineness at all, but I do find fault with the quality of the seed.

SALVIA SPLENDENS VAR. CLAVANAD is said to be an earlier blooming and longer lasting form than that in common cultivation, also that it has longer flower spikes.

SALVIA PATENS LILACINA.—In *S. patens* we have one of the most splendid blues in flowers, and we shudder at the thought of a lilac variety of it. *S. prunelloides* that was resurrected a year or two ago is no good; *S. farinosa* is a pleasant, pale blue, continuous blooming species, and *S. Picheri* an excellent fall-blooming species with deep blue flowers. None of them are quite hardy.

TORENIA "WHITE WINGS" is a white flowering form of *T. Fournieri*. It was sent out two or three years ago, then it seemed to drop from notice till this season, when I find it again occupies a conspicuous place. I have grown it continuously since it first appeared, and find it as easy to grow, free blooming and long-lasting as the typical form, and, in its way, a real pretty little flower.

TROPEOLUM LOBBIANUM, VAR. ASA GRAY.—A perennial nasturtium said to have pale primrose or soft sulphur-yellow flowers—the lightest color yet produced.

ARISTOLOCHIA ELEGANS, a novelty of a few years' standing and still high priced. A tropical vine, easy to raise, free growing, free blooming, and one of the prettiest flowering of the genus. The flowers are more odd than useful. I saw it in beautiful bloom at Mr. Kimball's at Rochester, N. Y., last summer.

Nomenclature.

S. A. F. Committee on Nomenclature.

JAMES D. RAYNOLDS, Riverside, Ill., Chairman.

Roses:

ROBERT CRAIG, 49th & Market Sts., Phila., Pa.
EDWIN LONSDALE, Chestnut Hill, Phila., Pa.
ERNEST ASMUS, West Hoboken, N. J.

Carnations:

A. E. WHITTLE, Albany, N. Y.
JOHN THORPE, Pearl River, N. Y.
WM. FALCONER, Glen Cove, N. Y.

Palms, Ferns, and like Decorative Plants:

CHAS. D. BALL, Holmesburgh, Phila., Pa.
JOHN BURTON, Chestnut Hill, Phila., Pa.
W. R. SMITH, Botanic Garden, Washington, D.C.

Chrysanthemums:

JOHN THORPE, Pearl River, N. Y.
WM. FALCONER, Glen Cove, N. Y.
J. M. KELLER, Bay Ridge, N. Y.

Bedding Plants:

G. L. GRANT, 54 La Salle St., Chicago, Ill.
ROBERT CRAIG, 49th & Market Sts., Phila., Pa.
J. M. KELLER, Bay Ridge, N. Y.
A. E. WHITTLE, Albany, N. Y.

Orchids:

DAVID ALLAN, Mt. Auburn, Mass.
BENJ. GREY, Malden, Mass.
WM. FALCONER, Glen Cove, N. Y.
J. FORSTERMAN, Newtown, N. Y.

Mrs. Alpheus Hardy.

SYN. "OSTRICH PLUME CHRYSANTHEMUM."

At page 367 of the AMERICAN FLORIST I see your correspondent, Mr. W. W. Herron, calls attention to this subject, and very justly complains of the annoyance it causes him in his trade. He is not the only one who could raise a complaint against such practices by all accounts I hear. But what strikes me most, as I doubt not it will many other readers of the FLORIST, is the comment immediately following his remarks by the editor, where it says "This is rather a knotty problem. It seems unwise to multiply names and still we can hardly object to catchy, popular names when the correct name is also given." Now if I understand the meaning of this it is virtually endorsing the whole line of renaming plants by any one who wishes to do so to suit any advertising scheme or otherwise. True, there is a proviso, but what good is that? The original name can be as Mr. H. says it is in this case, printed in small type and the "catchy" one in a large striking type and all who see it will scarcely ever notice the original name.

If the AMERICAN FLORIST, of all papers in the country, is going to countenance such practices then it is utterly useless for the Society of American Florists to have a committee on nomenclature. Better let them be discharged at once and let the matter drop for ever. If a chrysanthemum already having a name which is recognized as a suitable one, and one, by the way, which almost every one who has ever heard of a chrysanthemum must be familiar, as no other name was ever so thoroughly advertised in connection with this family of plants before, why in common justice to the public at large should another name be given to this plant. The name "Ostrich" is no more applicable to this particular flower than a cabbage is to a clam or an oyster to an onion. True the flowers have some short hair like protuberances on the petals which give it a distinct appearance from other white chrysanthemums, but I fail to see wherein it can be compared to an

ostrich plume. If the "catchy" name is to be admitted, then the whole list of substituted names of the past and present must be admitted also; but why are they necessary? Is it not much more just, fair and honest to call a plant by its right name? Anything else it may be necessary to say about it can be done in the description of the same without infringing upon any one's rights or laying ourselves open to the charge of trying to deceive the public by misrepresentations. I think it would be a good thing to thoroughly ventilate this subject in the *FLORIST*; let us hear from others, as the subject is an all important one to all parties, more particularly to those who wish to do an honorable business. JOHN N. MAY.

[Let us have the expression of opinion by all means. We will make no further comment until the returns are all in; then we may add another word. However, there is hardly any necessity for "ventilation"; the matter ventilates itself, for the correct name appears in conjunction with the other, and this fact must be borne in mind.—Ed.]

Piqueria Trinervia.

This plant has been in cultivation 25 years or more under the name of *Stevia serrata*, which is an entirely different plant. The piqueria in cultivation grows 3 to 5 feet high; it is woody at base and has 2-ranked, pubescent branches and opposite, lanceolate, acute, serrate, three-nerved leaves and branching corymbs of flowers. Its involucre is campanulate and consists of 4 or 5 bristly-tipped scales; the seed is angular and without pappus. *Stevia serrata* is a herbaceous plant about 18 inches high, branching, and the upper part pubescent. Its leaves are alternate, linear, lanceolate, serrated at top and the petioles attenuated and smooth. Corymbs are fastigiate. The involucre is cylindrical, few leaved and equal, the receptacle naked and the pappus double. J. H. BRUMMEL.

Carroll Station, Baltimore, Md.

[Kindly send us good specimens of what you consider the misnamed plant for identification.—Ed.]

"Genista Canariensis."

My attention has just been called to some plants which arrived here a few days ago from a New York firm labeled *Genista canariensis*, which were exactly the same as our old friend *Cytisus racemosus*. Is it a case of substitution? or has the plant one name under the stars and stripes and another under the Union Jack? Any information through your columns on the subject would be very acceptable to many of your readers and to yours etc. JAMES MCKENNA.

Montreal, Canada.

"DAUGHTREY REGINA BEGONIA."—Some one has sent me the Portsmouth (Va.) *Progress* of March 2 last, containing a half column notice of a begonia for which the above name is proposed. It has the root and growth of the "gigantea family" and the foliage of "Schmidtii," "the blossom is like the gigantea rosea, save that it hangs pendant," and it is likened unto other begonias as a graceful woman is to a man laborer. "It is the result of Mrs. Dr. Daughtrey's skill and knowledge and is new to florists and seedsmen." "This Schmidtii gigantea" probably means B. Schmidtiana X B. semperflorens gigantea, for in describing new plants we must be precise. If it is absolutely new

and originated with Mrs. Daughtrey, then call it "Begonia Mrs. Daughtrey," and not the ludicrous name given above. And exhibit a specimen of it at the convention of the S. A. F. in Boston next August. W. F.

Insects and Diseases.

Conducted by CHARLES F. BAKER, Agricultural College, P. O., Ingham Co., Mich.
Send specimens of unidentified insects and diseased plants to him at above address.

The Carnation Twister.

A package of carnation shoots were lately received from G. Lester Hollis, of South Weymouth, Mass., which were presumably affected with the "carnation twister." By growing the shoots I have been able to make a few observations which may help to solve what has been called a "knotty problem." That the plants were affected by something was very evident. The leaves were curled and twisted up, and in many places the stems were bent back on themselves, while all of the plants had a sickly, dried out appearance.

One florist, who was consulted in regard to it, assured me that it was caused by "a very small moth, the larvae of which bored in the stem," while another claimed that it was not caused by an insect, but was a diseased condition. I found neither moths nor evidences of any "disease," but I did find a plant louse,

INSECT CAUSING THE "CARNATION TWISTER"
MUCH ENLARGED.

or green fly, and these in considerable numbers. They were, for the most part, safely ensconced at the base of the leaves between the leaves and stem.

They are aphids of the genus *Siphonophora*, to which also belongs the much dreaded Wheat Plant Louse. It has evidently not come to the attention of entomologists or florists till within a short space of time, for in a large amount of literature (entomological and floricultural), I found no mention of it or the insects causing it. The insect is about three thirty-seconds of an inch long, and its body pear-shaped. Its color is a light green about the body and head, while the tips of the nectaries, beak, feet and antennae are brown and the eyes black. The legs are long and slender and the antennae almost as long as the body and articulated with tubercles situated on the front part of the head. This describes only the apterous female as no winged forms were found. The female crawls away by herself and, after finding a convenient place, usually the axil of a leaf, gives birth to a number of young lice, which immediately begin feeding on the juice of the plant, which they suck out through their long jointed beaks. Being almost the color of the plant, they can not be detected by a careless glance, but close examination at once reveals them.

Just as soon as evidences of their presence are noticed, steps should be taken towards their extermination. If an attempt is made to grow cuttings from affected plants, it will be very probable that they also will have the "twister," as the females in search of a breeding place crawl to all parts of the plant and to adjoining plants. In the greenhouse tobacco smoke is undoubtedly one of the best remedies. Out of doors kerosene emulsion applied forcibly in a fine spray from all sides will soon rid the plants of lice. This may be prepared by mixing in a tin vessel one pint of kerosene, one quart of soft soap and between one and two quarts of water. This should be heated, continually stirring it until nearly boiling. It should then be diluted with water until one part in fifteen is kerosene. Numerous other remedies have been recommended, such as sprinkling with ashes and lime and spraying with strong soap suds, weak lye or tobacco water, the latter being made by boiling one pound of the stems or leaves in a gallon of water.

It may seem like presumption to suppose that such a common pest as the green fly was also the cause of the "twister," but when we see the effects of the work of nearly related insects on the Snowball and other plants, it does not seem at all improbable.

Slugs Among Violets.

I dislike to contradict any one, but when Mr. John Mull says (page 388) that tobacco dust will not hurt the violets, I shall have to disagree with him. I tried that remedy thoroughly last year and my experience was, that as long as there was any strength to the dust that the slugs did not trouble the violets, but it had to be renewed, and after a time I found that the plants did not like it, although it did not immediately affect them. I would not mention this only I am afraid that others will try this, and unless their tobacco is different from any I have had they will be sorry in the end.

Then R. P. Jeffrey & Son say use bran with paris green; I will try this, although I had been recommended to try bran alone before and found that the slugs would not touch it. Perhaps their taste is cultivated.

Perhaps I ought to state here that I find tobacco dust most excellent to keep down the slugs on benches holding pot plants; spread over the gravel or ashes two or three times during the winter, they will not trouble anything standing on it, and it also keeps down green fly to a great extent, seldom having to fumigate where it is so used. R. E. SHIPLEY.

Chatham, N. Y.

—In your issue of February 15 I notice Mr. S. P. Cutler asks for a remedy for slugs. I have found slaked lime put round tender seedlings as lettuce, peas, etc., will keep slugs off, and I believe if scattered under the runners and around the violet plants would prove successful. It is used a great deal in England, where slugs and snails are so numerous, and would be worth trying here.

W. K. H. ABBOTT.
Mimeapolis, Minn.

SEND IN YOUR records of number of blooms cut from a given number of plants, occupying a given space, during a given length of time. Give the number cut during each month if possible.

OUR NEW TRADE DIRECTORY is now ready. It gives a complete and accurate list of the florists, nurserymen and seedsmen of the U. S. and Canada. Price \$2.

Cost of Production.

Mr. Chitty forgot to charge himself with commission or labor for selling his flowers, which will amount to at least 25 per cent, between rent of store, waste and incidentals which would bring his profits down to about \$636.

As to quantity of flowers cut from a given amount of glass, a well known Jersey City florist told me he cut 40,000 Grace Wilder flowers a week for weeks at a time, all long stemmed, from a house 80 feet long by 18 feet wide so that he can cut more in two weeks than Mr. C. can in twelve months out of one third less glass.

JOHN BIRNIE.

Jersey City, N. J.

—A grower for the New York market writes:

"Mr. Chitty states that he sold his carnations for \$2 per 100. I have never known carnations to average over \$1 per 100. This would show a profit of \$99.68 instead of \$848.71 from his house. We are not all so fortunate as to have a store in which to place our goods as Mr. Chitty has, and we have to sell in the open market. In New York carnations sell in the fall months for 50 cents, 75 cents and \$1 per 100; in winter they sometimes reach \$3, and again in spring drop back to 50 cents and 75 cents. You will thus see that it is impossible to get an average of \$2 per 100 when the flowers are sold in the open market."

In considering the price realized by Mr. Chitty it should not be overlooked that all his flowers were on long stems, and judging from the flowers he has sent us at times, of the finest quality. Several leading Chicago retail florists who viewed a large bunch of Grace Wilders sent us by Mr. Chitty declared that they could easily get double usual prices for such flowers. It is quite probable that the wholesale price of carnation blooms throughout the country and during a season will average something less than \$1 per 100. But we have no doubt that Mr. Chitty could have cut a much larger number of blooms had high quality not been a desideratum.

The Buttercup.

On page 368 of the last issue of the Florist, H. G., of Springfield, Mass., seeks information regarding Buttercup carnation—temperature, soil and general conditions of culture, to which I take pleasure in writing a few words in reply, because ever since my first acquaintance with this splendid variety in 1885, my success in its culture has been of a most gratifying nature. I therefore feel it incumbent upon me to speak a good word for it wherever and whenever opportunity offers.

Under ordinary favorable circumstances Buttercup is an immense grower, often throwing up shoots as thick as one's thumb for 12 or 15 inches in height before the first signs of flower buds appear, and such shoots will sometimes produce 12 or 15 flowers of the finest possible description. I have seen plants of this variety flowering as described, while seemingly hanging on to a little light poor soil with the bulk of its roots ex-

posed during the heat of summer, and under conditions indicating general neglect; with these facts in view I think it reasonable to conclude that neither heavy nor rich soil are essential to the successful culture of the Buttercup.

My soil is a dark sandy loam, similar to what would generally be regarded as ordinary good garden soil, but quite light in texture, and as the soil is pretty much all alike there is no chance for favoritism. The plot intended for the growth of my carnations next summer is now covered (besides the six inches of snow that fell yesterday) with a close growth of red top; last June a heavy crop of clover was cut from it, the clover when well started again was plowed under early in August, it was then well harrowed and heavily seeded with red top and harrowed again. As soon as the weather is favorable this plot will be deeply plowed and otherwise prepared for the carnations. I may say that late in the fall this same plot was enriched by a large heap of refuse matter such as rotten tobacco stems, cleanings from the houses and sheds, leaves, weeds and rubbish of every description, all thrown together and allowed to decompose, this spread over the surface and plowed in with the clover and red top be all the fertilizing material my carnations will receive the coming summer, and this may be regarded as a fair example of my practice for several years past, and generally with moderately fair success—of the preparation of the ground for summer growth of my carnations. From experience I feel prepared to say that a heavy summer growth of carnations is by no means an essential feature of their successful culture, and this is more particularly the case with sorts like Buttercup that are liable to make a heavy growth in a strong, highly enriched soil. I think with a light soil and a moderate use of thoroughly decomposed manure that H. G. can grow the Buttercup at Springfield, Mass., with perfect success.

As regards temperature, I have never discriminated in favor of Buttercup or any other variety, but think 50° or 55° sufficiently high as a maximum night winter temperature for all carnations, and even a much lower temperature seems to induce a wonderfully robust growth; and although the flowers are somewhat longer in coming I am very much inclined to think that it pays in the end.

H. E. CHITTY.

Paterson, N. J., March 20, 1890.

COST OF PRODUCTION.—Should not Mr. Chitty deduct 50 per cent from net profits on his carnation house to go to credit account of his store?

J. W. Y.

New York Odds and Ends.

I set out one morning recently to spend a day in haunting my old camping grounds at Astoria, L. I., for it was at the nurseries of Isaac Buchanan, in that slow Long Island village, that I found my first "job" after coming to this country. "The flowers that bloom in the spring" have many times died since last I saw the old place, and it was with a good deal of regret that I noted the desolation time had wrought. But two or three of the houses are now standing, and these contain nothing of interest; the "foreman" tells me that Mr. Buchanan has sold the place to private parties who will take possession first of May next. The greenhouses will then be torn down, the ground divided into building lots, and so another of our pioneer florist places will have been wiped out.

Continuing my pilgrimage I ran foul of Mr. Pritchard's place and spent a long and pleasant hour with that gentleman. Long before he added brilliancy and weight to American floriculture, Mr. P. was a shining light of the craft in England, carrying off so many exhibition honors that his British brethren were truly delighted when he pulled up stakes and came to America. His houses at Astoria contain a little of everything, but the "elephant" on exhibition just now is a particularly fine variety of coreopsis, name unknown, seed of which he got from France two years ago. It bloomed in his grounds last summer for the first time, and the flowers proved quite popular with the cut flower trade. Half a dozen of the plants were lifted late last fall and planted in a cool house; at the time of my visit they were just coming into bloom, so that I had an opportunity to get a fair idea of this acquisition. It certainly looked attractive, the flowers are a bright golden yellow, one and a half to two inches in diameter, and are borne in the greatest profusion. The plant is perfectly hardy, and in catalogue parlance, ought to be in every collection.

Carnations and bulbs are W. H. Siebrecht's specialties. Of these, particularly the latter, enormous quantities are grown annually for the cut flower trade; every inch of available space in his dozen large greenhouses is utilized, in addition to which there is a finely arranged shed where the bulbs are stowed until removed to the houses, a much better plan than the more general one of burying them outdoors. This shed is also used for retarding or "keeping over" a crop when occasion requires. A batch of gladioli were coming on nicely, varieties used being Shakespeare, Eugene Scribe, Isaac Buchanan and Brencleyensis. Bulbs were started in pots November 2, '89, subsequently planted out on the benches, and according to Mr. Siebrecht's reckoning, they will flower in about eighteen weeks from date of starting. A couple of houses are given up to carnations; of the several varieties grown Mr. S. considers Brilliant (syn. Portia) to be the best red, and Hinz's the very best white. One small house, or pit, is used for violets; viewed in the light of others we have seen, the plants looked healthy, but W. H. isn't altogether satisfied, he is quite convinced that there is a disease to which the violet is particularly susceptible and that its ravages are chiefly felt in the vicinity of large towns and cities. His theory that the disease is caused by the foul air common in the neighborhood of cities and manufacturing centers, is by no means the most improbable of many we have heard.

David Dean has one of the neatest, cleanest little places on Long Island. Mr. Dean's houses are devoted chiefly to roses and carnations, and both are handled in a style that leaves nothing to be desired. A house planted with Miles' spiral mignonette Mr. Dean regarded as the most profitable house on his place. It seems difficult to obtain seed of the genuine Miles' spiral, more's the pity, for it's a variety well worth having, and to those who don't know any better, the following will convey some idea of what may be achieved in the way of "big" mignonette with this popular variety. Last season '88-'89 Mr. Dean selected a good strong flowering shoot of "Miles spiral" to which he devoted special attention; he watered it intelligently, kept it carefully tied up to a stake, etc., so that the shoot waxed strong and the flower spike grew and continued to grow "till it couldn't grow any more higher," and the

aforsaid flower spike having attained its majority measured exactly 50 inches in length. This is no "yarn" my brothers, at least I'm not responsible if it is; I have given it to you as it was told to me by the gentleman himself, and considering his vocation he adheres very rigidly to facts. In the rose houses I was specially interested in a batch of Woottons, they were planted July, '89, but so far had not given satisfaction. I also saw this rose in fine condition at W. C. Wilson's, where it is regarded as a first rate variety.

Having already heard a good deal for and against the Wootton, I said to myself and the person I addressed agreed with me, that it might be interesting to have the opinions of a few leading florists in New York city concerning it. The first man I interviewed was Mr. A. LeMout. Generally speaking he thought the rose hadn't yet been properly or sufficiently tested; in his own trade he found it to go well, and considered it A No. 1 for decorative purposes and the very best shipping rose he ever handled. His main objections were its scarcity and lack of fragrance. Klunder was brief and to the point; he likes the Wootton when well grown and esteems it a good rose particularly for decorative work. Thorley regards it as a very poor keeping rose and further complains that it doesn't work in harmoniously with others of similar color such as Bennett, etc., but he agrees with LeMout that the Wootton will have to be more generally grown before its merits can be properly determined. Mr. Young (Thos. Young, Jr.) could only say that Woottons consigned to his house were quickly bought up by the retail dealers. He considers it quite an acquisition, and as to its keeping qualities he had heard no complaints and added facetiously that he "couldn't keep a sample on hand long enough" to decide the matter for himself. Mr. Siebrecht, of Siebrecht & Wadley, arranged his silk hat in a becoming position and proceeded to discuss the Wootton with considerable energy. His views, briefly put, are: That Wootton is a good rose, does well early in the season, that it will doubtless do well through the spring months, but during the dark short days of winter it doesn't develop satisfactorily. He regards American Beauty, of which he is an enthusiastic admirer, and Mermet as the best selling roses in the market to-day, and I find that the principal retail florists in the city without exception, pronounce Mermet to be by long odds the most popular rose of its class with their customers. A. W. M.

Steam Heating.

In reply to query by John Ralph, Saratoga Springs, N. Y., as to length of time that steam apparatus can be left without attention, I herewith give my experience.

I have had steam in my houses four years. I leave my boilers eight to ten hours without attention and if weather is not stormy as much as 24 hours. But to do this there must be a large fire space and I burn very hard egg coal. No doubt there are other readers of the *FLORIST* who have the same trouble, and to such I am willing to answer any questions that I am able to. WM. SALING.

Rahway, N. J.

In reply to John Ralph's query, page 376. We put in steam last fall for the first time, and it works well. We keep our fire 12 hours without attention in this way. At 3 p. m. we shake out all ashes from the grate, leaving only live clean coals and put on enough coal

to last until 8:30 p. m.; then we shake out grate again until the fire is bright under the grate and fill with coal even to the bottom of feed door, if boiler has a return flue put more coal onto the back end and slant down to feed door. We sift all our ashes and pile the cinders in a convenient place near the boiler. Then we take the watering pot and sprinkle the cinders until they are damp throughout—not too wet but just right, and then we cover this coal we have just put on with cinders about three inches deep, even it all over with the poker, shut the door and hook on chain to automatic damper and in 15 or 20 minutes, according to the draft of your chimney, your automatic damper closes, your steam is up. Then lock up your house and go home, next morning at 8 or 9 o'clock you will find your fire there, and steam too. Springfield, Mass. H. GRANT.

I have been heating with steam for several years and always had to have a fireman until this last winter. I have put on a self-regulator instead of opening the draft doors as they generally do. I have it arranged so it opens the doors of the fireplace and regulate it with weights. If the steam rises up to a certain point—say 10 pounds—it will open the doors and the steam will keep up for several hours, until it commences to drop lower than 10 pounds, when it will close the doors gradually and the steam will rise. There is no danger of getting the steam too high. I use soft coal and can leave my apparatus without attention in zero weather for four hours, when merely at freezing point for five to six hours. I have found the regulator to work very satisfactorily and it saves fuel.

Kansas City, Mo. A. F. BARDE.

In answer to Mr. Ralph's query in last issue I would say I have used the Parks Patent boiler for the last five years. I start my fire about 4 p. m., at 8 I fill with coal and leave for the night. If it is cold, say down to 15°, I will throw on about half a bushel of coal at 8 a. m. If the thermometer stands 40° above I do not go near it until 4 p. m., twenty-four hours, and keep up 2 to 4 pounds of steam, thus far I have used twenty-two tons of coal and heat about 25,000 cubic feet of space.

Edw. S. HASKELL.

New Bedford, Mass.

In reply to Mr. Ralph I will say that I never leave my boiler more than three or four hours through the night. I see to the fire at 9 p. m., 1:30 a. m. and 5 a. m. For coal I use one half Cumberland to one half pea, with very good results, but if I employed a night fireman I think I would use all pea coal. I have used steam for four years and I like it very much; prefer it to hot water or flues, both of which I have used. I use 1½ and 1½-inch pipe with a 3-inch main. A 13 H. P. boiler heats 7,000 feet of glass very easily. J. W. MINOTT.

Cape Elizabeth Depot, Me.

In reply to Mr. John Ralph's inquiry on steam heating, I find that unless thermometer falls below 28° Fahrenheit I can fire at 10 p. m. and need not return until 7 the next morning. When colder than this a night fireman must be on hand. J. W. Y.

Germantown, Pa.

In the *AMERICAN FLORIST* of March 15 Mr. John Ralph inquires about steam. On two of the coldest nights we had this winter, when the thermometer went to 8°, my steam boiler ran itself for ten hours without attention. In milder

weather it will run for fifteen hours. Three pounds of steam maintained a temperature of 50° in two houses. I make a practice of getting up once during the night to be sure all is well.

Ridgewood, N. J. F. LORILLARD.

Philadelphia.

The seventh annual supper of the Florists' Club of Philadelphia, was even more enjoyable than those which have preceded it, which is saying a very great deal. Among those present from a distance were John N. May, Summit, N. J.; Wm. J. Stewart, Boston; M. H. Norton, Boston; J. L. Dillon, Bloomsburg, Pa.; M. A. Patton, Lowell, Mass.; A. Dimmock, Summit, N. J.

The menu was so elaborate that it is given in full below:

The Botanical Laboratory at the Michigan Agricultural College Burned.

AGRICULTURAL COLLEGE, March 24.—At 12 o'clock last night the botanical laboratory was discovered to be on fire and two hours later nothing remained except the tall monumental chimney. The students worked under the direction of Lieut. Simpson, but having only one hose and a weak stream of water they could do little beyond checking the fire a little. The fire started in the third story

and worked slowly down. The building was of wood, cost \$7,000 and was the first built in this country and one of the largest and best arranged botanical laboratories on this continent. The Wheeler herbarium, comprising 7,000 species of Michigan plants and representing 25 years of work, is burned. The collection in the museum, worth \$4,000, is half destroyed, including the collection of woods which took first premium at the centennial. The students saved the instruments, including forty microscopes worth \$2,000, also nine-tenths of the herbaria. Dr. Beal's library and manuscripts, which were on the first floor, are saved. The loss to science can not be estimated in dollars and cents. The museum represented years of search and collection by Dr. Beal and his assistants, and can never be fully replaced. Mr. Wheeler says if he is granted ten years more of life he will replace his herbarium. —*Detroit Free Press.*

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant ads. not admitted under this head.

☞ Advertisements for April 15 issue must REACH US by noon, April 9. Address

THE AMERICAN FLORIST CO., Chicago.

WHEN SENDING anything for our inspection, please do not fail to enclose your card in, or write your name upon, the package. Unless this is done it is frequently difficult to identify the package with your letter. A reference in your letter to "some carnation flowerseed by this mail" is not sufficient, as in all probability "some carnation flowers" will arrive from some other sender in the same mail, and without further identification it is impossible for us to say which is which. Where possible it is best to enclose the communication in the package with the specimens.

THE HORTICULTURISTS' RULE BOOK, by L. H. Bailey, contains an immense amount of useful information in a condensed form. The chapters on insecticides, injurious insects, fungicides, plant diseases, etc., seeds, miscellaneous tables, including quantity of water held by pipes of various sizes, number of gallons in circular and square built tanks and cisterns, analyses of various fertilizers and other substances, are of decided value to florists for reference, and we should consider the book invaluable to the general horticulturist. Published by the Garden Publishing Company, New York.

SPRING FLOWERS.—Prof. Watson, of the Bussey Institute near Boston, writes under date of March 14: *Galanthus Elwesii*, latifolius, imperati, nivalis and n. fl. pl., *Bulbocodium verum*, *Colchicum crocifolium*, crocuses in great variety and *Eranthis hyemalis* are all in fine bloom with the bees at work. *Chionodoxa Lucillie* and *C. Sardensis* and *Scilla amena* are showing color here in my beds. Some *Galanthus* (snowdrops) *Elwesii* have been in bloom since January 3.

NIGHT-BLOOMING CERES.—We have received a photograph of a handsome plant of this ceres belonging to Mrs. E. P. Beebe, Elizabeth, N. J. It bears fourteen open flowers and had borne thirty flowers in all. The plant is 16 years old and has bloomed three different times during the past summer, at the second blooming having thirty blossoms, opening on different nights.

THE HENRY SHAW SCHOOL.—Florist Andrew Washburn, Bloomington, Ill., writes: "My son, Geo. A. Washburn, after reading your editorial 'The Henry Shaw School,' made application for examination, was successful and has been awarded a scholarship and will enter upon the studies and training April 1, '90."

OUR NEW TRADE DIRECTORY is now ready. It gives a complete and accurate list of the florists, nurserymen, and seedsmen of the United States and Canada, designating the special branch of the trade each one is engaged in. Price \$2.

THE FREQUENCY with which such terms as naked receptacles, double pappus, campanulate or cylindrical involucres, bristly involucre scales, etc., have cropped out in a note on nomenclature which appears in this issue, causes us to drop a tear for the benefit of the committee on nomenclature.

OUR HARDY FRUITS, by Brian Wynne, F. R. H. S., editor of the *Gardening World*, a 63-page book in paper covers, has been received from the publishers, Messrs. Eyre & Spottiswoode, London, England. It treats on fruit culture in England in a very practical way.

LAMBERT'S GARTENFREUND is the title of a small book in paper covers received from the publishers, J. Lambert & Son, Trier, Germany. It contains cultural notes on garden and decorative plants in the German language.

BOOKS ON LANDSCAPE GARDENING.—In response to several queries as to the best works on landscape gardening we have obtained a list from Mr. Henry Sargent Codman, which we give in another column.

PRINT your spring trade list in the next issue of the AMERICAN FLORIST and mail copy for same as early as possible.

FULL REPORTS of the spring exhibitions held at Boston and Philadelphia will appear in next issue.

Catalogues Received.

Thomas S. Ware, Tottenham, London, England, seeds; same, chrysanthemums; same, bulbs; same, dahlias; Geo. Thompson & Sons, Louisville, Ky., trade list plants; Fred P. Burr & Co., Middletown, Conn., seeds; T. S. Hubbard Co., Fredonia, N. Y., small fruits; W. L. Smith, Aurora, Ill., trade list plants; Mrs. J. S. R. Thomson, Spartanburg, S. C., trade list plants and shrubs; Gillett & Horsford, Southwick, Mass., wild flowers, shrubs, trees and vines; C. H. Murphey, Urbana, O., trade list plants; F. W. Kelsey, New York, nursery stock; John Thorpe, Pearl River, N. Y., chrysanthemums; E. S. Nixon & Sons, Chattanooga, Tenn., plants; B. P. Critchell & Co., Cincinnati, O., plants and seeds; Lewis Roesch, Fredonia, N. Y., grape vines and small fruits.

Coming Exhibition.

April — — New Orleans.—Annual Exhibition, New Orleans Hort. Society.

April 22–25, Detroit.—Floral and musical festival.

June 24–25, Boston.—Rose and strawberry exhibition Mass. Hort. Society.

August 19–22, Boston.—Annual exhibition Mass. Hort. Society.

October 28–Nov. 1, Atlanta, Ga.—Chrysanthemum show, Piedmont Exposition Co.

November 10–14, Philadelphia.—Chrysanthemum show, Penna. Hort. Society.

November 11–13, Boston.—Chrysanthemum show, Mass. Hort. Society.

November — — Chicago.—Chrysanthemum show, Chicago Florist Club.

BUFFALO.—Wm. Scott has a house of Garfield carnations worth seeing. The plants carry at present from 50 to 75 buds each and are in a splendid condition of luxuriance and health.

EVERGREEN, ALA.—The recent heavy frost has completely ruined the new crop of wild ferns. They were growing finely when the frost came, but now they look as though they had been burned over.

News Notes.

ROCKFORD, ILL.—H. W. Buckbee has been laid up with "La Grippe" for the last two weeks.

BUFFALO, N. Y.—Owing to the short time available for preparation and some other causes of a local nature, the Florist Club's project of a spring flower show was abandoned.

HARRISBURG, PA.—Joseph Schmidt has sold his greenhouse establishment to Logan E. McClintock, the present lessee. Mr. Schmidt will retain his store at 44 North Third street.

ST. PAUL.—At the recent meeting of the Society of Minnesota Florists the Executive Committee was instructed to make every endeavor to induce the Society of American Florists to hold its 1891 convention in Minneapolis.

NEW YORK.—Arthur, youngest son of Mr. and Mrs. H. A. Siebrecht, died at their home in New Rochelle on March 19, of pneumonia. The bereaved parents have the sympathy of a very large circle of warm friends in their loss.

OTTAWA, CANADA.—The Valley of Ottawa Gardeners' and Florists' Club has, pursuant to a resolution unanimously passed at the meeting held February 13, forwarded a letter of sympathy to the surviving relatives of the late Peter Henderson.

BALTIMORE.—The Gardeners' Club of Baltimore elected officers as follows at the annual election March 8: President, Wm. McRoberts, Jr.; Vice-President, John Donn; Secretary, Henry Bauer; Financial Secretary, Chas. G. Campbell; Treasurer, Wm. B. Sands; Librarian, C. M. Wagner; Assistant Librarian, Chas. Egner.

WASHINGTON.—The *Evening Star* of March 8, contains an article giving in extensive detail the design which Mrs. Harrison has had prepared of an addition to the White House. Among other things included in this design is "the extension on the south side of a wide conservatory or winter garden with a central rotunda or palm house."

PHILADELPHIA.—Thomas Foulds, formerly gardener for Mr. Wm. M. Singler, has started in business for himself at Gwynedd on the Philadelphia and Reading R. R., where he has eighteen acres of land, upon which he is about to erect four greenhouses each 100x20, heated by steam. The new place will be known as the Gwynedd Nurseries.

AMERICA, GA.—Encouraged by the warm summer-like weather of February I had put out my tender plants and the cold snap of March 1, 2 and 3, and which was the severest we have had for years, has destroyed all. The cold has been disastrous, destroying everything, flowers and vegetables. All trees and shrubs had put forth and the new growth is dead.

BUFFALO.—At the annual election of the Buffalo Florists' Club held March 14, the following officers were chosen for the coming year: President, William Scott; Vice-President, C. H. Keitsch; Secretary, D. B. Long; Recording Secretary, E. J. Mcpeck; Treasurer, Thomas Clayton; Executive Committee, W. J. Palmer, Wm. McMillan, Wm. Milley. After the election the members sat down to the annual dinner, at which toasts were happily responded to by many of the members, and Messrs. T. Mansfield of Lockport, and G. R. Miner of Hornellsville, who were present as guests.

AMERICAN FLORIST CO., 54 La Salle Street, CHICAGO.

GREENHOUSE HEATING.

BY A. B. FOWLER.

Explains fully all the best systems of heating greenhouses by both hot water and low-pressure steam. Tells you the points to consider in selecting an apparatus. How to adjust same to various locations; gives the results of the latest scientific experiments. Shows how to compute the number of feet of pipe required for a given space; draft and other important matters. It is highly commended by Mr. John Thorpe and others. Postpaid, 75c.

Sent on receipt of price. Address,
AMERICAN FLORIST,

1890 DIRECTORY.

Every Florist, Nurseryman and
Seedsman should have one.
AMERICAN FLORIST CO., Chicago.

We can now furnish in any quantity desired Debit and Credit Tickets of which we give below samples reduced one-half in size.

DEBIT. <i>Jan'y 10 1889</i>			
<i>John Smith</i>			
100	<i>Verbenas</i>	3	-
50	<i>Geranium</i>	4	-
		7	-

CREDIT. <i>Jan'y 10 1889</i>			
<i>Richard Roe</i>			
500	<i>4 inch pots</i>	5	-
17 1/2	<i>"</i>	5	-
		10	-

The debits are printed in black and the credits in red, so they can be readily distinguished. They are put up in blocks of 100 of each, placed back to back: thus but one block will have to be carried. By means of these tickets an entry of a sale or receipt of goods can be made anywhere—in the house or in the field—and afterwards filed. Tickets for each transaction in your business will make data from which a book-keeper can readily work. With this simple and easy means of keeping a record of your business can you afford to neglect so important a matter?

Price of Tickets, postpaid, 100, 20c.; 200, 35c.; 300, 50c.; 500, 75c.; 1000, \$1.40.

AMERICAN FLORIST CO.,
54 La Salle Street, CHICAGO.

Killing Greenfly.

The apparatus for killing greenfly mentioned by A. H. Lange, Worcester, Mass., and illustrated on page 336 of No. 110, of the FLORIST, I have tried with great success. It is the best, most effective and least troublesome I have ever tried. Would recommend it wherever steam is used.

In reply to John Ralph, Saratoga Springs, N. Y., I would say, that my steam heating apparatus can be left safely from ten to twelve hours without attention, which I find very convenient.

Lockport, N. Y. CHAS. L. DOLE.

Rose Gloire de Margottin.

The brilliant velvety scarlet blooms of this new variety are very attractive and slow to show any purple tint after cutting. The bud is long and of fine form, the half open flower, however, shows a weakness in two or three of the outer petals which may hurt it for cut flower purposes. It is quite fragrant and may prove a dangerous rival to the Jacq.

I. C. VAUGHAN.

Primula Obconica.

I would like the experience of brother florists, who have grown the Primula obconica. Does it poison the hands in taking care of it, or cutting the blooms? With me it is sure to poison if I come in contact with the leaves, and I have thrown out my entire stock thinking it unsafe for my customers to have. B.

Lilium Harrisii Bulbs

THE BERMUDA EASTER LILY.

Having made arrangements to handle the entire product of several of the largest growers of the Harrisii Lily in Bermuda, we are prepared to offer the trade at extremely low prices, the finest stock of these bulbs ever brought to the States.

Careful personal inspection of the growing crops assures us that the bulbs offered are entirely free from blight and mixture, and that they are 1st class in every respect. If in the market for these bulbs, write us stating quantity and sizes wanted, and we will quote prices by return mail. Bear in mind that on orders sent us AT ONCE the bulbs can be shipped in time to force for the CHRISTMAS HOLIDAYS if desired.

NO "SYNDICATE" BULBS!

LOUIS BREMOND FILS,

Grower of ROMAN HYACINTHS and OTHER FRENCH BULBS,

OLLIIOULES, VAR, FRANCE.

JANUARY, 1890.

TO THE TRADE:

I am informed that Mr. C. Mertz, who was a clerk in my employ until August, 1889, and who resides in Paris now, is making offers of Roman Hyacinths and other bulbs, on behalf of a "Syndicate." I hereby announce to my customers that I have nothing in common with this so-called "Syndicate," and that I disclaim all connection with that or any other organization.

My bulb crops for next season are in a flourishing condition. I can furnish you with any quantity you may require, at very favorable prices, which may be obtained by addressing

Mr. J. A. De Veer,

183 WATER ST., NEW YORK,

MY SOLE REPRESENTATIVE FOR UNITED STATES AND CANADA.

Yours Respectfully,

LOUIS BREMOND FILS.

CARNATIONS.

5,000 well rooted cuttings Hinze's White, the most prolific bloomer and best keeper grown, \$12 per 1000.

DeWITT BROS., Bristol, Pa.

Chicago.

At the last meeting of the Florists' Club the subject for debate was as to whether a removal of the present duty on bulbs would be a benefit or detriment to the trade. When submitted to vote, after an exhaustive discussion, it was decided by a close vote in favor of the abolition of the present duty.

That Easter is almost at hand was evidenced by a visit from Mr. Wm. J. Stewart, of Boston, last week.

Jim the Penman and a copy of the Dictionary of Gardening alighted here last week while on a flight to the Pacific coast.

Mrs. J. C. Vaughan and Miss Florence Vaughan left recently on a trip to California.

At the next meeting of the Florist's Club the cut flower commission man will be cussed and discussed. Reserved seats, at a safe distance from the seat of war, have already been spoken for.

Violets Losing Fragrance.

I have some complaint that my violets lose their fragrance by the time they reach the retailer. They are fragrant enough when bunched and packed and are delivered within 12 hours after being packed. They do not get their heads wet and are packed carefully in boxes lined with wax paper. Can any violet grower tell me how to handle this flower so as to preserve the fragrance better?

HARDY ROSES in all sizes, from 3-inch pots up to 6-inch pots. Also dormant two year old stock.

L. A. CASPER, COUNCIL BLUFFS, IOWA.

2-inch Pipes.

"A Beginner" in your issue of March 1 asks information about heating a greenhouse with 2-inch wrought iron pipes. This can be cheaply and satisfactorily done on the high pressure plan. Hang a coil of 1 1/4-inch pipe over the furnace, connect this with 2-inch pipe in the house and put a cock and safety valve at highest point. Run 3/4-inch pipe from hydrant to lowest point in return pipe and admit water by means of a check valve. When all air is driven from pipes the water will circulate with tremendous rapidity. A house requiring 800 feet 4-inch pipe should have at least 600 feet 2-inch pipe with 100 feet reserve and 50 feet 1 1/4-inch pipe in coil. No expansion tank is needed. On a small place this arrangement will be found very satisfactory, as it is economical and easily managed. Perhaps Messrs. Brown & Son do not have pressure? JOHN WELSH YOUNG.

Germantown, Pa.

ON THE NIGHT of March 6 the large greenhouses and part of the stock of J. C. Gibson, Woodbury, N. J., were destroyed by fire. Mr. Gibson advertised a large stock of plants in our issue of March 1st, but is now unable to fill orders for his new coleus, fuchsias, heliotrope, lantanas and verbenas on account of his loss, and money forwarded by patrons for these plants will be returned when matters have assumed proper shape. He still has a large stock of new chrysanthemums, Begonia Saundersonii, hollyhocks, ageratum and tuberoses, grape and blackberry plants, from which he would be pleased to fill orders.

Florists' Letters.

Emblems, Monograms, Etc.

These letters and designs are made of the best in monotypes, wired on wood or metal frames, having holes drilled in them to insert tooth-picks, by which they are fastened to the design. Give them a trial. You will find these goods to be superior to any in the market. PAT'D. & CO. 6, 1890.

NOTE.—All infringers or imitators of the above letters and designs will be prosecuted to the fullest extent.

Send for Sample.

The "PLANET JR." SEED DRILLS WHEEL HOES HORSE HOES

The "PLANET JR." No. 2 GARDEN DRILL, is beyond question the best; sows the most difficult seeds; opens, covers, rolls down and marks the next row with the greatest regularity.

The COMBINED DRILL and HOE, &c. The greatest favorite ever produced. Perfection as a Seed Drill, or as a Plow, Hoe, Garden Rake, Cultivator or Marker. Saves labor and seed and soon saves cost.

The DOUBLE WHEEL HOE. A money saver for farmers and gardeners. Works both sides of a row at once. Plows to or from, opens furrows, covers, cultivates, hoes, rakes and has leaf guards.

The SINGLE WHEEL HOE is a treasure. Beats the double in some crops; is lighter. Has a Large Plow, two Long Hoes, two Rakes, three Cultivator Teeth, and a Leaf Guard.

The FIRE-FLY SINGLE WHEEL HOE. Equals the best, except has no rakes nor leaf guard.

The FIRE-FLY GARDEN PLOW. Worth its price yearly in a garden 20x40 feet.

The GRASS EDGER. The newest, neatest, cheapest and best machine known for edging paths and flower beds.

The 1500 HORSE HOE. The finest tool and most costly to make that we have ever offered. Yet the result justifies our care, as every one who sees the tool will admit. The first grand improvement is our new patent Lever Expander, one all farmers admire and which they will pay \$3.00 for, to put on old machines. The next feature is our patent Handle Shifter, enabling one to walk to one side of his work, worth \$3.00 a day for some crops. Yet we ask but a small additional price for both these new features. Why not send for full descriptive catalogue of these and all our other S. L. ALLEN & CO. Patentees and Sole Manufacturers.

useful improvements? Free to all. S. L. ALLEN & CO. 1107 Market St. PHILADELPHIA, PA.

An Absent Minded Florist.

Some very amusing stories are current regarding the absent-mindedness of one well known and much respected member of the trade, among them the following:

His wife had presented him with a very handsome watch and chain, and the next day he returned from a trip to the city minus the same. When his attention was called to the absence of the time-piece he concluded that it had been either lost or stolen from him. But on retiring for the night it was discovered that in making his toilet for his trip to the city he had put on his white shirt without removing either the old shirt or vest, and the watch was brought to light, calmly reposing in its usual place, when he disrobed.

He drove down town one day, left his rig standing in front of a store, forgot he had driven in, took a train, went home, and next day wondered why the horse was not in the stable.

He went to the city one day, stating on leaving that he would be home for supper. Nothing heard from him for two days, when a telegram was received from a city nearly a thousand miles distant announcing his presence there. He had, it appears, made an engagement to be there at that date, but had forgotten all about the fact until late in the day, and when it occurred to him he took a train at once without thinking of notifying his family until he had reached his destination. Then he bethought himself of the anxiety his absence would create and sent a telegram.

One morning he decided to go to the city and repairing to the house donned a white shirt, forgetting to remove the other one. Just as he was about to start, some matters in the greenhouses claimed his attention, and not wishing to soil his white shirt, he sought his room, found a work shirt, put it on over the white one, got the dirty work out of the way, returned to the house, donned another white shirt over those he already wore and went his way. He remarked to several during the day that it seemed to be rather warm, but the cause was not discovered until he disrobed at night.

On another occasion he had an acquaintance on whom he had called, hunting all over the place for an umbrella, which he announced that he had lost, and it was not until asked whether he had brought two umbrellas, that he realized he had been holding the useful article over his head all the time.

The authenticity of all these stories is not vouched for, but the probability is that they are but little overdrawn.

IMPORT DUTY ON PLANTS.—As will be noted in another column, a bill is now before Congress which provides for an import duty on plants. Believing that many of our readers may wish to protest against any increase of duty on some or not all of this stock, we have supplied a convenient sheet for protest in supplement enclosed with this issue, which may be used or ignored as they may deem best.

OUR NEW TRADE DIRECTORY is now ready. It gives a complete and accurate list of the florists, nurserymen, and seedsmen of the United States and Canada, designating the special branch of the trade each one is engaged in. Price \$2.

You may know it all, but if you make no use of your knowledge it is valueless to you.

New York.

After a Lenten period, which has not been nearly so dull as usual, a good Easter was naturally expected, and with few exceptions the New York men express themselves as greatly satisfied. Some of them find their trade greatly increased over that of last year, and in no case was it less. A very large quantity of stuff was sent in, and a majority of the wholesalers found themselves pretty well sold out on Saturday night. One large wholesaler says his sales were fully 30 per cent greater than last year, and as no one complained that his trade was less than previous Easters it is reasonable to infer that it would average an increase over former years.

On the whole, flowers were very fine; indeed every festival of this kind proves that the New York market emphatically demands good flowers, and has no place for poor ones. The constantly growing taste for boxes of loose flowers, rather than baskets or designs, has a good deal to do with this, because when flowers are not made up they stand entirely on their own merits and do not depend on any accessories. The fashionable florists say that the call for any sort of designs is now very small. Formerly they had a good many memorial designs for Easter church work, but this year they were very few; a great many plants were sold in their place, or else cut flowers.

Lilies were naturally the leading Easter flower. The quantity sold in and about New York was certainly tremendous; larger than last year. In addition to cut flowers they formed a favorite pot plant. Few, if any, were left over; the supply was short by Saturday afternoon. The standard price for lilies was \$15 a 100. Some few were sold higher in small lots, but that was the prevailing price. Earlier in the week some were sold for \$10 and \$12; some of the growers had an idea that they might be over-plentiful, but such was not the case; perhaps the market might not have taken many more, but all in were sold readily.

The dealers were singularly unanimous in prices; the scale was about the same all over the city, as far as wholesale men were concerned. There was little difference from the prices of last year. Roses were very good; some few growers held back their stuff, rushing in nearly all the week's cutting on Friday and Saturday,

to the detriment of quality, and consequently of prices, but there was hardly so much of this as usual.

There were superb Jacqueminots in, they sold well, as this rose always does when really good; they varied from \$10 to \$25 a 100. Weigand, who has always enjoyed a reputation for this rose, sent in remarkably fine flowers, while Siebrecht & Wadley sold grand Jacqs of their own growing.

La France varied greatly in quality, and consequently in price, going all the way from \$6 to \$25 a 100. Perle, \$6 to \$8 a 100; Bride and Mermet, \$8, \$10 and \$12 a 100; some sold for more, but not many. Souvenir, Cusin and Watteville the same. Bon Silene, Papa Gontier, \$6 to \$8; Hybrids averaged \$40 a 100; some few very fine ones brought more, but a good many brought less. Neyrons, Rothschilds and Brunners were very fine. Julius Rochrs sent in grand hybrids; so did the Messrs. Asmus, Schultheis and others. Singularly enough, Prince Camille de Rohan which, under the trade name of "Black Jacq," sold well a few seasons ago, does not seem to take at all this year; some very good flowers were in at Easter, but no one seemed to want them.

Carnations were not so plentiful as usual, they sold for \$4 to \$5 a 100. They have not generally done well the past winter, which may account for their comparative scarcity now.

Tulips, which seemed almost a drug a week before Easter, were not over plentiful at that date, they brought \$3 to \$4 a 100; Lily of the valley \$4 a 100; violets 50c to \$1 a 100. A very large quantity of violets was sold. Smilax and asparagus 25 and 35 cents a string.

Church decorations, while presenting no specially new features, were certainly more elaborate than in former years, and there was a largely increased use of flowers on the part of churches which formerly made little display in this way. Similarly, there was an increased trade from people who are not ordinarily flower buyers. The sale of flowering plants was very large, many of the churches buying a majority of those used in decorating, and distributing them to the hospitals afterwards. Lilies led among pot plants, as well as cut flowers; next came azaleas, hydrangeas and lilac, while genista was largely used.

There is no doubt that the sale of plants large though it was, would have been still larger if Friday had been fine, but it was so wet and blustery that the florists could not make any display outside, and a good many buyers did not venture out. Besides, people are always inclined to buy plants and flowers more liberally in fine weather than the reverse. Saturday was another bad day, it was fine, but the wind was so high and boisterous that plants and flowers were transferred with difficulty; it could hardly have been worse

as far as lilies were concerned. But in spite of all these disadvantages trade was certainly excellent.

It will be noticed that no fancy prices were realized, they were really moderate, but as one dealer said, people are more ready to buy at Easter, because they can show something for their money. It seems recognized as essentially a feast of flowers, even among those who do not pay any attention to it in other ways. Averaged all round, the volume of trade must have been decidedly larger than last year.

All the florists' stores were finely arranged, many of them making a regular exhibition. Hodgson, Burns, McConnell, Thorley, Siebrecht & Wadley, in fact, all of the large retailers made very fine displays.

Easter Monday was certainly a very slow day, but a good many festivities came off that week, which benefitted the florists. Even the least enthusiastic said Easter trade was better than last year, while many spoke of it as remarkably increased.

EMILY LOUISE TAPLIN.

Boston.

Easter trade for 1890 seems to have given general satisfaction in this vicinity. The weather for several days preceding the day was fine and encouraged flowers to bloom and flower buyers to come out and buy. The number of plants disposed of must have been enormous, all reports indicating that this particular branch of Easter work has seen a large increase this year.

Cut lilies sold well, the preference seeming to run to *Harrisii* as compared with *candidum*, but the market was fully stocked with both these varieties and all demands were easily filled at moderate prices. The call for roses was largely increased over former years and some varieties were in very short supply. Tea roses were almost extinct and could they have been obtained would have brought almost Christmas prices. The same was true of carnations, there not being one tenth of the quantity required obtainable. Other scarce articles were *smilax* and tulips. Violets were fairly abundant and the sale of them was immense.

The various churches decorated about as usual, nothing of an extraordinary nature having been noticed. W. J. S.

CHICAGO.—Easter trade averaged about 15 or 20 per cent larger than last year. There was a notable increase in the call for *Harrisii* lilies and a correspondingly smaller demand for callas. There were but very few good *candidums* to be had, the majority being very poor in quality. Other stock averaged about the same as last Easter in quality, prices also averaged about the same as last season. There was a full supply of all flowers except carnations and colored roses. Quite an increase in the call for blooming plants was noted by those who handle them. Upon the whole the Easter trade of 1890 was very satisfactory. It was noticeable that the churches used more loose flowers and less designs than heretofore.

MINNEAPOLIS, MINN.—From 10 to 25 per cent larger than last Easter with an increased call for lilies and other white flowers. Supply was nearly equal to demand, prices somewhat lower than last Easter. Some of the florists do not increase prices any at Easter, selling at same rates as usual. Quality of flowers was fully up to the standard, in some cases being much better than last year.

Increased call for blooming plants. Plants are now very largely used in church decoration to the exclusion of cut flowers and designs.

LOUISVILLE, KY.—Easter trade shows a decided increase each year in this city, the present Easter trade exceeding that of last year by about 25 per cent. In spite of the great demand the supply was nearly equal to it and the quality was better than in previous years. And people are beginning to pay better prices for first class stuff. There was an increase in the call for *Harrisii* lilies. A particularly noticeable feature was the falling off in the call for baskets and designs; everyone wanted loose cut flowers. Church decorations did not amount to much.

PHILADELPHIA.—About 20 per cent larger than last Easter, the increase being almost entirely in sales of blooming plants. Prices ruled about the same as last Easter except on lilies, which were lower in price owing to the large quantities placed on the market. The supply of all flowers was about equal to the demand at prices asked, the quality being possibly a trifle better than last year. Next to lilies, fine hydrangeas were in best demand, though all flowering plants sold unusually well.

INDIANAPOLIS.—Much larger than last Easter owing to fine weather. The main increased call was for lilies, violets, roses, carnations and daffodils. Prices were about the same as last year, but there were less complaints from customers, as quality was much better. Supply was nearly equal to demand. Good blooming plants sold well at an increase of about 25 per cent over last year. Loose flowers constituted the bulk of the sales, few baskets and designs being called for.

CINCINNATI, O.—About 25 per cent larger than last year. An increased call for *Harrisii* lilies and less demand for callas. Main call was for roses, lilies, violets and carnations. Prices ruled about the same as last year and home-grown flowers were better in quality. There was an increased call for blooming plants, especially for lilies, roses and hyacinths. While the orders averaged smaller in amount there was a greater number of them.

EVANSVILLE, IND.—About 20 per cent larger than last Easter and prices obtained about 10 per cent better. Supply was equal to demand except lily of the valley, quality of flowers much better than last Easter. Larger demand for *Harrisii* and *candidums* in pots and cut callas and lily of the valley. In spite of the three weeks of miserable weather which preceded Easter the supply was very good.

BUFFALO, N. Y.—About one fourth larger than last Easter. Prices were quite as good as former years. Could have sold more roses, violets and carnations. Home grown flowers were of excellent quality. A great increase in the demand for fine flowering plants of every kind. Church decorations were fully up to former years and 50 per cent more plants were sold on the streets.

DES MOINES, IA.—About 25 per cent larger than last year. Increased call for callas, *Harrisii*, *candidums*, tulips and roses. Prices obtained were better than last year, supply not equal to demand. Quality of flowers better than last year. But little call for plants; people here loan their house plants to the churches. Boxes of loose flowers were in greatest demand, but little call for baskets.

PITTSBURG.—About 25 per cent larger than last Easter with increased call for *Harrisii* lilies. Large supply of flowers of good quality and prices a trifle lower than last year. Increased call for blooming plants over last year. The quantity of cut flowers handled was much larger than any previous year. Florists here are exceedingly well pleased with the Easter trade of 1890.

DENVER, COLO.—About the same as last Easter with increased call for potted callas. Prices about as usual at this season. *Candidums* and callas were scarce. Quality of stock was good except on roses, many of those to be had had been held for some time. A decided increase in the call for blooming plants. Strange to say some violets were left over.

WORCESTER, MASS.—About 25 per cent larger than last Easter. Supply good and no advance in prices. Quality of Dutch bulbous bloom much better than previous years. In plants there was an increased call for azaleas, lilies, tulips, narcissus and hyacinths. Palms and other ornamental plants were largely called for to use in decorations.

SCRANTON, PA.—About 20 per cent larger than last Easter, largest increase being in the call for hydrangeas, Dutch hyacinths and *Harrisii* lilies. Supply equal to demand except on those noted as in increased demand. Quality of all flowers except carnations was better than last Easter. A decided increase in the call for blooming plants.

BALTIMORE.—Much in advance of last Easter, at least 10 per cent increase. Supply not equal to demand, prices somewhat lower than last year, quality of flowers rather better. Great increase in the call for blooming plants. The decorations in the cemeteries were a great feature in this city, they were much more frequent than usual.

RICHMOND, VA.—Much larger than last Easter, two florists reporting double the amount of sales made last year. Less call for *candidums* and more for *Harrisii*. No change in prices from last year, supply hardly equal to demand. Quality of flowers compared favorably with last Easter. A very largely increased call for blooming plants.

NEW HAVEN, CONN.—About 10 per cent larger than last Easter with more demand for *Harrisii* lilies and less call for *candidums* and callas. A good supply of everything except carnations, quality about as usual except lilies, which were poorer. Prices rather lower than last Easter. A small increase in call for blooming plants.

SPRINGFIELD, ILL.—About 25 per cent larger than last Easter with increased call for *Harrisii* lilies and *Spiraea japonica*. Increased demand for white flowering plants; not much sale for geraniums or callas. With eight to ten florists here we are generally equal to any occasion, but Easter trade this year hustled us.

COUNCIL BLUFFS, IA.—One third larger than last Easter with increased call for *Harrisii* and decreased demand for *candidum* lilies. Prices about one third lower than last Easter, quality of flowers better, supply equal to demand. The weather being fine and Easter coming early gave us a tremendous amount of bloom.

MEMPHIS, TENN.—About 25 per cent larger than last Easter. More call for *Harrisii* lilies and less for callas. Supply was not equal to demand, quality and prices not quite so good as last year.

A SMALL SHOW HOUSE. [SEE PAGE 431]

One florist reports an increase and another a decrease in the call for blooming plants.

DETROIT.—Much larger than last Easter with increased call for Harrisii lilies and choice roses. Prices ruled about the same as last year, supply equal to demand, quality good. A good demand for blooming plants at good prices, especially for azaleas, rhododendrons, roses and hydrangeas.

LONDON, ONT.—About one fourth larger than last Easter. Prices about same as last year, possibly a trifle better. Supply short, no marked difference in quality from last Easter. Not as much church decoration as formerly, but more loose flowers sold for house decoration.

UTICA, N. Y.—About 15 per cent larger than last Easter, prices about same as last season, supply not equal to demand, quality of flowers about same as last year. Increased demand for blooming plants. White flowers seemed to be wanted more than others.

HAMILTON, ONT.—Larger than last Easter with increased call for Harrisii lilies, prices better, supply short, quality good, increased call for blooming plants. Buyers as a rule neglect to order until a day or so before Easter and many are disappointed.

PEORIA, ILL.—Much larger than any previous Easter and sold at better prices. There was a very liberal supply but could have sold more. Quality of flowers rather better than last year. There was an increased call for well grown plants of all kinds.

NASHUA, N. H.—About 10 per cent larger than last Easter, supply a little short of meeting the demand, prices ruled about the same as last Easter, candi-

dums not up to standard in quality. A slight increase in the call for blooming plants.

KANSAS CITY, MO.—About same as last Easter. Increased demand for lilies, less call for narcissus, valley and azaleas. Prices about as usual at the season, supply equal to demand, quality better than usual. Decrease in call for pot plants.

GRAND RAPIDS, MICH.—About one third larger than last Easter with an increased call for violets, valley, tulips and similar spring flowers. Prices about same as last Easter, supply somewhat short, quality of flowers fully as good as last year.

PROVIDENCE, R. I.—Much larger than last Easter, the main increase being in pinks and roses. Supply not equal to demand and quality of flowers not so good as last season. Pot plants of Lilium Harrisii were in demand at \$1 each.

DALLAS, TEXAS.—Much larger than last Easter with decided increase in call for lilies, prices better, had to order flowers from eastern cities to help meet demand. Quality of roses fair, lilies fine. Increased call for blooming plants.

SAN ANTONIO, TEXAS.—Owing to the coldest norther we have had this winter striking us February 27, the supply of flowers for Easter was quite inadequate to supply the demand and floral work was very scant.

ATCHISON, KAN.—Trade was one third larger than last Easter; every thing went clean, prices about the same as last Easter. Very few set pieces sold, the weight of the trade being in loose flowers and plants.

WILMINGTON, DEL.—Somewhat larger than last Easter with increased demand for Harrisii lilies. Prices ruled same as last year, supply nearly equal to demand,

quality good. Increased call for blooming plants.

ST. PAUL.—Larger than last Easter, prices about the same as last year, supply equal to demand, quality equal to previous years. Some florists noted an increased call for the cheaper grade of flowers.

ALBANY, N. Y.—About 25 per cent larger than last Easter, quality of flowers about the same as last year, prices obtained somewhat higher, supply was equal to demand at prices asked.

SPRINGFIELD, MASS.—Much larger than last Easter, prices and quality of flowers about the same, supply short. Increased call for potted plants of Harrisii lilies, hydrangeas and choice plants.

TORONTO, ONT.—Much larger than last Easter. Prices about the same as last year, quality of flowers better, supply equal to demand. Roses and valley led in demand.

HARRISBURG, PA.—Much larger than last Easter. Supply rather short and quality not quite as good as last year. Decided increase in the call for blooming plants.

MILWAUKEE.—Larger than last Easter, prices somewhat better, supply about equal to demand, quality of flowers better. Very little made up work called for.

DAVENPORT, IA.—About 10 per cent larger than last Easter, prices about as usual at the season, supply short, quality good, no change in call for plants.

WORCESTER, MASS.—Easter sales were larger than last year, the calls being mainly for loose flowers. Quality of flowers was good.

IOWA CITY, IA.—Easter trade the best for years. All flowers sold at fair prices. Roses and lilies in the lead. No call for plants.

Philadelphia.

The spring exhibition of the Pennsylvania Horticultural Society was pronounced by competent judges to be one of the finest ever given by the society at this season of the year. The arrangement of the exhibits was very effective, and the attendance was very satisfactory.

As might have been expected there was considerable interest manifested in the contest for the \$300 premiums for the Wootton Rose, offered by C. Strauss & Co., of Washington. The first premium, \$150, was awarded to J. N. May, about which there was no question. But Joseph Heacock himself, who was awarded second premium, \$100, quite expected that Coles and Whitely, who received third of \$50, would have had the second prize.

It was conceded by all rose growers present that the Bennetts which Pennock Bros. exhibited were the finest ever seen here. One enthusiast went so far as to say, "They were the finest ever grown." They certainly were magnificent large flowers, bright color, ample foliage, and on stems probably eighteen inches long. They were grown by Aldrich Pennock, of Lansdowne, a young son of the old and well known firm of that name.

Joseph Heacock's roses were all fine, as may be understood by a glance at the premiums as awarded.

C. F. Evans has some fine Ulrich Brunner and Magna Charta, and his La France were superb.

There was a second award made on the third day for cut roses; Coles & Whitely carried off a goodly number of premiums on this occasion.

Pennock Bros. had some fine cut flower work—a dinner table design. Some of the favors were Sweet Peas, which attracted much attention, as they have never been seen in this city at this season of the year before.

Craig & Co. decorated the stage with palms and other fine foliage plants which was quite a feature.

Pitcher and Manda's display of orchids was of course the "Star" attraction. Too much cannot be said in praise of this firm's enterprise in bringing so many fine specimens so long a distance. It is not, perhaps, the distance, so much as the inconvenience of shipping valuable plants, in the manner which has to be adopted—that is, by express. If it were possible to charter a through freight car, it would be much less expensive, more satisfactory and an even larger display could be made.

The center of the hall was taken up by four large tables of decorative growing plants which were in competition for three premiums. One hundred feet was the original space allotted to each exhibit, but it was mutually agreed upon by the officials and the exhibitors that 140 feet be allowed, which proved to be a wise move, as it gave the whole show a more easy and graceful appearance, and the space was filled to better advantage. It will be seen that the veteran prize taker, Wm. Joyce, secured first honors.

Heron & Nisbit had a grand display of cut flowers.

Joseph Kift & Son added to the interest of the exhibition by some novel window decorations.

PREMIUMS AWARDED.

The following premiums were awarded: For a collection of orchids in bloom—First, to Pitcher & Manda; second, to Chas. F. Evans.

For three orchids in bloom—First, to David Emery, gardener to Charles Dissel; second, to Pitcher & Manda.

For azaleas, six plants, six varieties, not over eight inch pots—First to W. K.

Harris; second, to F. R. Sykes, gardener to Mrs. Harry Ingersoll.

Azaleas, two plants, two varieties—First, to Robert Wark, gardener to E. W. Clark; second to Fred R. Sykes.

Azaleas, specimen, white—To Robert Wark.

Azaleas, specimen, any color—First, to Robert Wark; second to David Emery.

Zonal geraniums, 12 plants, 12 varieties—To J. W. Colflesh.

Zonal geraniums, six plants, six varieties—To J. W. Colflesh.

Zonal geranium, specimen—First to David Emery; second, W. K. Harris.

Collection of twenty-five plants, different varieties, in bloom—To J. W. Colflesh.

Decoration of growing plants, not over 140 square feet—First, to William Joyce, gardener to Miss M. L. Baldwin; second, A. Lutz; third, Robert Wark.

Rose, specimen—To W. K. Harris.

Ferns, twelve varieties—To Thomas Long, gardener to A. J. Drexel.

Fern, specimen—First to Robert Wark; second, to David Emery.

Hydrangeas, six plants—First, to W. K. Harris; second, to H. Engler; third, to J. W. Colflesh.

Hydrangeas, specimen—First, to W. K. Harris; second to J. W. Colflesh.

Spiraea Japonica, 6 plants—First, to Craig & Brother; second, to W. K. Harris; third, to H. Engler.

Cinerarias, 12 plants—First, to Thomas Long; third, to Gebhardt Huster, gardener to Mrs. Heyl.

Hydrangeas, 6 plants—First, to W. K. Harris; second, to H. Engler; third, to J. W. Colflesh.

Marguerites, 6 plants—First to W. K. Harris; second, to J. W. Colflesh.

Mathiola, 6 plants—Second, to J. W. Colflesh.

New or rare plant—Thomas Long for Heliconia aureo-striata; second to Pitcher & Manda.

Fifty bedding plants in bloom—First to Gebhardt Huster; second to Henry G. Standen.

Callas, 6 plants—To H. G. Standen.

Six Cyclamen—To David Emery.

BULBS.

25 Hyacinths—First to Henry Surman; second, to W. K. Harris; third to Gordon Smirl.

12 Hyacinths—First, to Henry Surman; second, to W. K. Harris; third to Robert Wark.

Tulips, six varieties—First, to Henry Surman.

Tulips, in boxes—To Henry Surman.

Tulips, 12 varieties—To Henry Surman. Twenty-four single Narcissus, trumpet variety—To Henry Surman.

Lilium longiflorum—First to C. D. Ball; second, Craig & Bro.

Lilium Harrisii, six plants—First to W. K. Harris; second to Craig & Bro.

Lilium candidum, six plants—To J. W. Colflesh.

Specimen Lily, any variety—To W. K. Harris.

Special premiums as follows: For collections of foliage plants, to H. A. Drecker and Charles Dissel, Esq.; for a collection of Anthuriums, Pitcher and Manda; for window decorations, to J. Kift & Son; for Hydrangea, "Thomas Hogg," to John Curwen, Jr.; for specimen plants, to F. R. Sykes.

The John Gardiner & Co. premiums for spring bulbs—First, to William Jamison; second, to J. W. Colflesh. Special mention to W. K. Harris for a box of crocuses.

DESIGNS.

Basket of cut flowers—To Pennock Bros. Six corsage bouquets—To Heron & Nisbet.

Bride's bouquet—First, to Pennock Bros.; second to Miss Annie Bisset.

Fair bridesmaid's bouquets—To Pennock Bros.

Vase of roses—To Heron & Nisbet.

Dinner table decoration—To Pennock Bros.

GROWERS' AND AMATEURS' LIST.

Collection cut carnations—To Henry D. Standen.

ROSES.

12 "Perle des Jardins"—First to Joseph Heacock; second, to C. F. Evans.

12 "Niphetos"—First to Joseph Heacock; second, to Gordon Smirl.

12 "The Bride"—First, to Charles F. Evans; second, to Coles & Whitely.

12 "W. Francis Bennett"—First to Joseph Heacock; second to C. S. Price.

12 "Papa Gontier"—First to C. F. Evans; second to Joseph Heacock.

12 "Sunset"—First, to Joseph Heacock; second, to C. F. Evans.

12 "Catharine Mermet"—First to C. S. Price; second, to C. F. Evans.

Any other variety—First to Edwin Lonsdale; "Mad. Hoste," second, to C. S. Price, "Pierre Guillott."

12 "La France"—First to C. F. Evans; second, to Gordon Smirl.

12 "Mad. Cusin"—First, to Edwin Lonsdale; second, to C. F. Evans.

6 "Mme. G. Luizet"—First to Edwin Lonsdale; second, to C. F. Evans.

6 "Mrs. John Laing"—To C. F. Evans.

6 "Merveille de Lyon"—To C. F. Evans.

6 "Ulrich Brunner"—First to Edwin Lonsdale; second, to C. F. Evans.

6 "Magna Charta"—To C. F. Evans.

The three special prizes offered by C. Strauss & Co., Washington, D. C., for 12 cut blooms of "Souvenir of Wootton" rose, were awarded as follows: First, to J. N. May, Summit, N. J., \$150; second to Joseph Heacock, Jenkintown, \$100 third to Coles & Whitely, Lansdowne, \$50.

FLORISTS' LIST.

Collection of Carnations—Pennock Bros.

12 "Perle des Jardins"—Pennock Bros.

12 "Niphetos"—Heron & Nisbet.

12 "The Bride"—First, to Heron & Nisbet; second, to Pennock Bros.

12 "W. Francis Bennett"—Pennock Bros.

12 "Papa Gontier"—First to Heron & Nisbet; second to Pennock Bros.

12 each of "Sunset," Catharine "Mermet," "La France," "Mad. Cusin," and 6 "American Beauty," and any other variety, to Pennock Bros.

6 "Gen. Jacqueminot"—First to Heron & Nisbet; second to Pennock Bros.

6 "Mme. G. Luizet"—First to Heron & Nisbet; second, to Pennock Bros.

6 "Mrs. John Laing"—First, to Heron & Nisbet; second, to Pennock Bros.

6 "Ulrich Brunner"—First, to Heron & Nisbet; second, to Pennock Bros.

6 "Puritan"—To Pennock Bros.

Boston.

MASS. HORT. SOCIETY SPRING EXHIBITION.

The usual exhibition of spring flowering bulbs, orchids, azaleas, etc., was held in Horticultural Hall on March 26, 27 and 28. In many respects it was one of the best exhibitions ever given by the society at this season of the year. The arrangement of the various displays was most effective and the quality of everything shown was uniformly good. Indeed, the show was most notable for the entire absence of anything of an inferior character and was throughout creditable to the society and the exhibitors alike.

SPECIMENS OF GERMAN FLORAL ARRANGEMENT. REPRODUCED FROM MOLLERS' DEUTSCHE GARTNER-ZEITUNG

In some sections of the bulb display the competition was light, and the number of plants shown not as large as on some former occasions. But the hyacinths were pronounced the best ever seen here, and some of the tulips, especially a set shown by A. H. Fewkes, were remarkably fine. The first prize for a general display of spring flowering bulbs was awarded to Chas. J. Dawson, and it was well worthy the recognition bestowed. The collection comprised a very large number of species and varieties, including many kinds that are rarely seen.

The leading premiums in the bulbous section were awarded to J. L. Gardner,

N. T. Kidder, Dr. Weld, Thos. Clark and W. S. Ewell.

The show of orchids was as usual the center of attraction for the visitors, and as a matter of course for the gardeners also. The handsomest plant in the hall was a *Dendrobium nobile* from Edward Butler, gardener at Wellesley College. It was an exceedingly well grown specimen, flowered clear to the bottom. The prizes offered for such plants at the spring show are entirely out of proportion to the skill required for their production, and seem most trivial when compared with the premiums for the Dutch bulbs. A special orchid exhibition, say about May when

valuable plants can be moved with safety, with premiums liberal in amount would no doubt be a good move for the society, and would receive a patronage from the public that would probably exceed that accorded to any other special exhibition during the year.

The display of orchids from E. W. Gilmore, of North Easton, was very fine, the plants being clean, well grown and well bloomed. Noticeable among them was a good specimen of *Angraecum Leonis*, which formed the center of the group. In N. T. Kidder's collection were three superb specimen *Cypripediums*. The orchids contributed by John L. Gardner, A.

W. Spencer and Norton Bros. were all beautiful and interesting.

The collection of hybrids exhibited by Mrs. F. B. Hayes, comprised over three hundred blooms in seventy varieties and was one of the best displays of cut roses ever shown here. It is doubtful if it can be equalled even in June.

The tea roses were well represented also, fine vases of the best varieties being shown by Thos. H. Meade, Waban Conservatories, Norton Bros., W. H. Elliott, A. P. Calder and Ernst Asmus. The latter named gentleman contributed fine specimens of Mme. Hoste, Mme. de Watteville and Mme. Cusin, indicating that New Jersey is still in the race on the rose question. Mr. Asmus also kindly served on the committee on awards, filling the place of an absent member, and the same committee was further enriched by the addition of Mr. Winfried Kolker, of New York, who fortunately was in Boston at the time.

In Indian azaleas the competition was slight. The Lyman Plate for six specimen plants was awarded to N. T. Kidder. Jos. H. White, Dr. C. G. Weld and Edw. Butler were also prize winners in this department.

Among the most attractive features of the show were an interesting collection of uncommon plants contributed by the Harvard Botanic Garden, a large variety of forced native spring flowering plants from Chas. J. Dawson, *Cypripedium acaule* from Jackson Dawson, a noble orange tree loaded with flowers and fruit in all stages from N. T. Kidder, and the very rare *Agave Vandervinnii* in bloom from W. E. Doyle. The appearance of the halls was greatly enhanced by contributions of fine palms, araucarias, bays and other stately plants from Frank Becker, and from W. E. Doyle. W. C. Strong and Temple & Beard also showed a number of potted evergreens, including some valuable varieties. The first prize for greenhouse plant was awarded to John L. Gardner for the old fashioned favorite *Eriostemon buxifolium*. Another nice specimen plant was A. H. Pewkes' *Streptosolen Jamesonii*. Mr. Zirngiebel was on hand with his pansies and took all the premiums. The *Bugnot*, *Cassier* and *Trimardeau* blooms shown by him were superb. In carnations there were some good ones from R. T. Lombard and Wm. Nicholson. Mr. Lombard's "Hector," a brilliant scarlet variety was an especial favorite.

The committee of arrangements found it difficult to get any idea in advance from the exhibitors as to what they would show, and their labor was needlessly increased thereby.

It was decidedly amusing to see how thoroughly everything was hidden from view when the committee made its rounds of the greenhouses just before the show, and all the secretiveness caused by dread that their competitors would in some way find out what they had and would take advantage of it. It might be a good idea to require the members of the committee of arrangements to take an iron-clad oath not to reveal any of the secrets exposed to their view to any person whatsoever, etc., and then possibly they could go on with their preparations intelligently. The gardeners are a very cunning craft.

WM. J. STEWART.

New Orleans.

The fourth spring exhibition of the New Orleans Horticultural Society was a decided advance over previous ones. The exhibits were large and of very good

quality and the attendance was very satisfactory.

Following is the list of awards: Best collection of plants—1st prize, J. H. Menard; 2d J. Muller. Best collection of geraniums—1st E. Valdejo. Best collection of caladiums—1st B. Rodder, gardener for Dr. Richardson; 2d J. Kling. Best collection of ferns—1st Jos. Muller and Delgado, medal; 2d Jno. Eblen. Best specimen fern—1st E. Valdejo. Best collection of *Rex begonia*—1st Jno. Eblen. Best collection of flowering begonia—1st F. Ritter. Best collection of palms—1st Jos. Muller; 2d J. H. Menard. Best collection of crotons—1st Jos. Muller. Best collection of orchids in bloom—1st John Eblen. Best collection of gloxinias—1st E. Eismhauser. Best collection of colons—1st J. H. Menard and Durant da Ponte, gold medal; 2d E. Valdejo. Best collection of cucurbitaries—1st E. Valdejo. Best collection of pansies—1st F. Ritter; 2d L. Jaeger. Best carpet bed—1st E. Beck. Best bed blooming plants—1st L. Jaeger. Best bed blooming and foliage plants—1st A. Palacio. Best vase and jardiniere—1st J. Kling, gardener for Mr. Hutchinson. Best hanging basket—1st J. Kling. Best bridal bouquet—1st J. H. Menard; 2d Charles Eble. Best hand bouquet—1st Charles Eble; 2d J. H. Menard. Best loose bouquet—1st Charles Eble; 2d J. H. Menard. Best corsage bouquet—1st J. H. Menard; 2d Charles Eble. Best table-decoration—1st Charles Eble; 2d J. H. Menard. Best handle basket—1st Charles Eble; 2d J. H. Menard. Best floral design, gold medal to J. H. Menard.

BY W. W. COLES.

[Read before the Florists' Club of Philadelphia.]

It is with much reluctance that I undertake to speak upon a subject so important as this, viz.: "What is the cause of the disease among winter-flowering roses commonly called yellows, and what is the cure?" I fully realize my inability to instruct such a body of older and more experienced florists, but as I am always willing to do the best I can when called upon by the craft, I have made a few notes of a crude nature on the subject.

The "yellows," a disease known among roses, has attracted considerable attention within the last few years, especially so this winter as it has been noticeable in more places than is usual. I have always made inquiries wherever I have seen this disease as to its cause and the answer in nine cases out of ten would be, "I don't know, it is a mystery."

The question was put some time ago to Mr. John Burton of Chestnut Hill, whom I consider one of the shrewdest and best rose growers in the country, and he assured me that it was not through over watering as is claimed by so many. So far as my experience and observation goes I agree with Mr. Burton and don't think it is so much the watering as most people imagine, or at least not over watering. I have a house of Brides and also a house of Mermets in my mind that I know have been kept very wet ever

since they were planted last summer, in soil which is a heavy clay loam; these plants are free from the "yellows" and perfectly healthy with the exception of one front bench of Brides which have this dreaded disease. These roses are on slate benches, the pipes running under the front and back tables, which, as a matter of course, would dry the plants out quicker, and as it is on one of these tables that the unhealthy plants are grown it goes far to prove Mr. Burton's assertion.

We do not see much of this disease till the dark days of winter set in, say the first of December, and if they are not past recovery they generally begin to improve after the first of March, when, as a rule, we can give the houses more ventilation.

Now I am of the opinion that one of the causes of this disease is a lack of some kind of food which the plants require during the absence of sunlight and air. I have used with satisfactory results sulphate of ammonia—a 4-inch pot full to about 300 square feet of bench, thoroughly mixed with a 10-inch pot full of bone or dry soil and put on as a top dressing.

The prevailing idea among growers that the disease is caused by over watering is easily accounted for, because as soon as any disease strikes a plant root action stops, and in a few days, with the usual amount of syringing, the bed becomes too wet, whereas if the plants were in a healthy and working condition they would absorb the ordinary amount of moisture; and thus the conclusion is arrived at, that because the beds are too wet, over-watering is the cause of the trouble, when such has been proven not to be the cause.

I have noticed that in every instance this disease is worse where the plants receive the least amount of air, viz.: through the center of a wide bench, the plants near the walks are always healthier and stronger where as a matter of course they get considerable more air.

Another cause may be cutting the buds too freely in the fall. We all know that roses produce a very heavy crop in October and November, and such varieties as *Bride*, *Mermet* and *La France* we have to cut with long stems to sell them. In so doing (if we cut all the buds they produce) we weaken the vitality of the plants to such an extent that they cannot recuperate before the dark days of winter are upon us. I am satisfied it would pay the most of us far better not to cut so freely in the fall months. There is no doubt in my mind that anything that weakens the vitality of the plants has a tendency to encourage this disease.

I must apologize for writing such a hasty and short paper but I trust enough has been said to bring out a discussion that will be profitable to us all.

Mme. Hoste.

The accompanying illustration is engraved from a photograph sent us by Mr. J. N. May. The rose occupying a central position is a bloom of Mme. Hoste, and a clear idea of its size and form may be obtained by comparing it with the bloom of Bennett at the left and *Bride* at the right.

A good idea of the size of the spike of *mignonette* may also be had by comparing it with the roses. It shows what may be done with this flower by careful culture and selection of the seed. The spike shown is grown from a select strain of Miles' Spiral.

Most Suitable Varieties.

Which are the most suitable varieties to grow? This is a question that is very

GIANT MIGNONETTE. MME. HOSTE.

W. F. BENNETT

THE BRIDE.

important to all of us who are engaged in the business to-day, whether it be for the large wholesale markets or for the local trade in smaller cities or towns. The first thing to consider is what will suit the purpose best under all circumstances. Some varieties will undoubtedly pay the grower better than others, yet it is hardly policy to grow those varieties to the exclusion of all others; particularly if they are for local or home sale. I have frequently been told that American Beauty does not pay the grower for any market except the very largest cities, and unless the buds can be sold at a good price it will not pay to grow it anywhere. For the smaller towns, where the grower retails his own flowers, Souvenir de Wootton will, if well grown, pay the florist very well, as it is very free flowering, produces a fine stem with handsome foliage; but it must be kept constantly disbudded, allowing only one bud to a shoot, otherwise it will be no good at all; but if well grown it is really a very good rose for the above purpose, and can be produced as cheaply as any other rose. But for the large markets where American Beauty will bring a fair price the Wootton is not wanted.

Some others that are good free bloomers and should be included in every collection even for the smallest local trade are La France, Duchess of Albany, Mme. Hoste, Marquis de Vivens, Mme. Watteville and Mme. Cusin. They are all very free blooming and will do well with reasonable treatment. The first two named are very large, perfectly distinct and desirable roses. Mme. Hoste (yellow) is also a very free flowering variety producing fine buds, quite distinct from any

other yellow; another good quality in the last named is that it improves in color after being cut and put in water for a few hours; it is a good keeper and will travel well.

Herewith I enclose copy of number of roses cut, per foot of space and value per foot up to February 28, though some of the varieties named on the list are hardly a fair comparison, such as Duchess of Albany and Mme. Hoste, as we have sacrificed a great many buds for the cuttings; in fact the same may be said of nearly all our stock, because if we are getting short of plants we throw very many buds away to get the wood when the roses are of little value in the market.

	Number of buds 1 st to Dec. 31, '89.		Number of buds 1 st to Feb. 28, '90.	
	Buds.	Cents	Buds.	Cents
Bon Silene	14.00	27.36	20.00	44.00
The Bride	4.53	25.17	6.45	42.26
C. Mermet	4.60	24.03	6.40	41.38
La France	9.00	55.00	13.50	86.38
Niphetos	11.80	35.91	16.99	54.35
Perle des Jardins	6.95	17.21	8.76	26.00
Papa Gontier	11.00	39.63	15.67	61.59

Summit, N. J. JOHN N. MAY.

A Small Show House.

I send you to-day a photograph of my "exhibition house." The view is from the office door and gives but a partial view of the house. Five years ago the largest plant in my collection was in a 4-inch pot and now I have areas ten feet high and latanias with five feet spread, and find the house pays as an advertisement of my business. The house is always kept in order and there is always something in it to interest lovers of plants. Many people come just to see this house and they usually buy something before they leave. So well assured am I that the house is a paying investment that I intend to build a larger and much better one for the purpose. C. C. BAUM.

Dover, Del.

Hardy Plants.

APRIL FLOWERS.

Many of the flowers mentioned, page 393, will last through April into May, and to those we may now (the middle of April) add many other species and varieties. From this time on till the end of June is the heyday of hardy plants so far as multitude in variety is concerned.

AUBRIETIAS are now little mats of violet, purple and rose-purple. Although so dwarf they are persistent plants, easy to raise from seed, easy to grow and long lived, but they love an open spot and are excellent plants for rockwork. Eyrei, Leichtlini, græca and violacea are pretty kinds.

HEPATICAS are plentiful in the woods on slopes, and if lifted and transferred to the garden they grow and bloom well. The double flowered varieties are jewels among spring flowers, but hard to get up a large stock of.

CALTHA PALUSTRIS or Marsh marigold or "cowslips" as they are called here-about are abundant in our swamps now; but there is a double flowering garden variety of it that is really a showy plant and easy enough to grow in a cool moist faintly shaded spot.

OROBUS VERNUS is a little purple and blue pea flower in bloom now. It grows in bunches 12 to 18 inches high, is very hardy and long lived and quite pretty, and seems to thrive well in the open border or partial shade. Easily raised from seed. And when about it get some seed of Orobis niger, also a small plant, and O. Lathyroides, a more vigorous species and later bloomer.

DORONICUMS.—D. Caucasicum is a moderately small plant with bright yellow sunflower-like blossoms about two inches across; D. Clusii is larger and nearly as early, and D. pardalinesch is still more vigorous and later. They keep in bloom for several weeks and are good open border plants. Easily increased by division. This had better be done in fall.

THE TWINLEAF (Jeffersonia), although a wild plant, is welcome among spring flowers; the blossoms are white and of brief duration. Likes a somewhat shady place. Easily grown, long lived and self sows itself freely where left undisturbed.

TRILLIUMS are handsome and desirable plants loving moist, faintly shaded quarters, and even doing fairly well in an open spot if the soil is moist. T. grandiflorum and T. erectum album are white and the best, but the purple and painted trilliums are nice garden plants. Stock is increased by collecting wild plants.

ENGLISH PRIMROSES.—These come in a little ahead of the showy polyanthus

and if grown in cold frames blossom with great profusion. As open air plants they must have a slightly shady spot in summer. Get up a stock from seed. But the seeds do not germinate readily, that is, I have never known half of the seeds sown to grow. The plants can be naturalized in moist, sloping woods.

POLYANTHUSES.—April is their heyday. The best results are obtained by treating them as cold frame plants in winter; in spring they may be left to bloom in the frames or lifted and planted in beds. Very easily raised from seed. If the seed is sown now the seedlings will bloom next spring. Splendid strains are in the market.

DAISIES.—These are most satisfactory when wintered and bloomed in cold frames. Or plant them out in beds in spring. The finest varieties are perpetuated by division, but a fine display may be had from seed. Longfellow and Snowball come freely from seed, and while there may be a good many singles or semi-doubles, the proportion of good flowers is considerable.

PULMONARIA SACCHARATA is the earliest of the borages, it has mottled silvery leaves and rose-purple or bluish flowers. Other two forms are *P. mollis* and *P. azurea*. Long lived perennials and worth growing on account of their earliness. The Virginia lungwort (*Mertensia virginica*) is a near relative of the pulmonaria and more beautiful, but later blooming. It grows very abundantly in some parts of the country. Other desirable kinds are *M. Sibirica*, *oblongifolia*, *alpina* and *Dahurica*.

HYACINTHS.—Roman hyacinths were in bloom with us out of doors in March this year, and we began cutting Oriental (Dutch) hyacinths at Easter, but they won't be in their best condition till the middle of April. Grape and leather hyacinths (*Muscari*) come in about the 15th to the 20th of April. The grape ones are desirable because of their persistent nature as well as beauty, the leather forms are odd, and the musk hyacinths rather inconspicuous.

PACHYSANDRA PROCUMBENS, a low native plant from the Alleghenies, is worth mentioning on account of the great profusion of purplish, but not showy, flowers it bears at this time. *P. terminalis* is a Japanese species, and a very pretty evergreen plant which will some day become quite a desideratum for growing in shady places. Its flowers are whitish, inconspicuous and freely produced. There is also a very prettily variegated leaved variety of this species in cultivation.

HELONIAS BULLATA is a New Jersey bog plant that takes kindly to cultivation in similar places. Its stout scapes rise one to two feet high and are terminated with close racemes of pretty pink flowers.

PHLOX SUBULATA, the moss pink, blooms from April into May. There are many varieties differing somewhat in the color of their flowers, also in the slenderness of their foliage and denseness of habit. The pure white is the best. We have a long belt of it which when in full bloom is like a wreath of snow. Can be increased from cuttings of the young or half ripe wood, rooted slips of the old wood or division of the clumps. About the end of the month *Phlox amana* and *P. reptans* also come into bloom and are bright and gay.

EPHYMBIA MYRSINITES has yellowish flowers and in its way is good looking enough, but not showy.

GEUM TRIFLORUM from the Sierra Ne-

vada is not a showy plant, but worth having because it is so easy to grow and long lived and lives well in the open border. Many of the pretty yellow kinds don't do this. *Geum coccineum* is the best of the garden sorts, and the double varieties deserve a place, but altogether we could get along without them.

STELLARIA HOLOSTEA grows wild in European woods, running freely in the grass, but here we grow it as an open border garden plant and it makes one of the handsomest snowy cushions in our borders, blooming in April and May.

VERONICA GENTIANOIDES is one of the earliest of our speedwells. A neat growing plant with upright spikes of pale blue flowers. A host of veronicas bloom later on.

DICENTRA EXIMIA, a handsome little plant with fern-like leaves and pink purple flowers that appear about the third week in April. It keeps in bloom all summer. Dutchman's Breeches and squirrel corn are also pretty little early blooming wild plants of brief duration. Towards the end of the month *Dicentra spectabilis*, well known in gardens as "bleeding hearts," comes into bloom.

CORYDALIS SOLIDA, the common early purple fumitory, comes in first among common sorts. It is an old and common plant and happy everywhere. A bolder and more showy species is *C. nobilis*, which does not bloom till May.

ANEMONE SYLVESTRIS is worth growing. It is easily raised from seed, blooms when a year old and loves faintly shaded, moist land, but will grow well in the open garden too. Its flowers are white and pretty.

THE UVIULARIS or bellworts come in about the 20th. Only those that grow in bunch-clumps, as *U. grandiflora* does, are worth growing; the creeping rooted sorts like *U. sessilifolia* are not showy enough.

IRIS PUMILA and its varieties are the dwarf irises so common in our gardens. They bloom in April and into May, and are generally known as spring irises.

THE EPIMEDIUMS are good garden plants, *E. macranthum*, white, *E. rubrum*, red, and *E. pinnatum*, yellow, especially. Although they will grow in the open border they love a shady place and good ground.

SAXIFRAGA CRASSIFOLIA, *cordifolia*, *ligulata* and *ciliata* are large, thick-leaved kinds and somewhat coarse looking, but they bear bold branched spikes of pink showy flowers in April and May. The first two seem to be perfectly hardy so far as frost is concerned, but dislike searing winds; the other two sometimes suffer in winter.

IBERIS SEMPERVIRENS began opening its blooms in March, but it will be the end of April before it is in perfection. A neat, evergreen, very hardy plant that becomes completely covered with white flowers. Indispensable to florists. It is being distributed innocently, but erroneously, as *I. Gibraltarica*, which is a biennial and barely hardy here.

COLUMBINES come in about the end of the month. The first is *Aquilegia Sibirica*, next *A. canadensis*, and then the great hybrid race which are only mongrels alongside of the lovely true species we grow.

AND SOME of the sea-thrifts (*ARMERIA*) now begin to bloom, and the bluetts (*Houstonia*) are scattered like tiny stars all over the meadows, the pearly everlasting is in bloom on the sunny bank,

and the yellow trollius in the moist border. The pink spring beauty is brightening up the woods and shady moist banks; white and yellow drabas bedeck our rockeries where also are the dark blue Appennine anemone, the golden anemone *A. ranunculoides*, Celandine poppy is blooming by the wayside, the great umbrella-leaved saxifrage in a wetish place, and gaudy tulips and bewitching pansies in the yard.

APONOGETON DISTACHYON.—Treated as a hardy aquatic, that is, planted in a warm sunny place and in water deep enough so that its roots may be beyond the reach of ice in winter, this beautiful and delicious water plant blooms from August or September till frost and in spring again from when the ice disappears till May. WM. FALCONER.

Nomenclature.

S. A. F. Committee on Nomenclature.

JAMES D. RAYNOLDS, Riverside, Ill., Chairman.

Roses:

ROBERT CRAIG, 49th & Market Sts., Phila., Pa.

J. FORSTERMAN, Newtown, N. Y.

Thanks It was Meant for Him.

EDITOR AMERICAN FLORIST.—DEAR SIR:—In your issue of April 1st I notice that your correspondent, "Taplin," refers to a party who is advertising certain novelties which can mean no one but myself, and asserts that I formerly sold an old familiar bedding plant as a novelty, under the title of "Rainbow Plant." Now this shows either malicious libel or a degree of ignorance unworthy any correspondent of the FLORIST. The seed I advertised last year as the "Rainbow Plant" is no bedding plant at all, but an annual, a variety of the amaranthus, as my catalogue plainly stated. It is the new variety introduced into Europe and America last year under the various names of *A. splendens*, *A. tricolor splendens*, *fulgens* and *Rainbow*.

This correspondent also refers to my advertising this year as "bearing about the same resemblance to the plants represented as the posters outside of a dime museum do to the freaks within," but in what respect the posters and freaks differ is not stated, and perhaps she is laboring under the idea that the posters fail to do justice to the freaks. It is, however, generally understood that the posters are deceptive, and this assertion that my advertising is fraudulent is a pretty broad one, and I desire your correspondent to state through the columns of this paper, in what respect the *Mary Washington* rose and *Rainbow Cactus* referred to do not come up to my claims. If your correspondent cannot furnish such information backed by positive proofs it is then in order for her to retract the statements she has made. The same correspondent also crit-

GROUP OF HYBRID ROCHEAS.

icises Messrs. ——— for advertising a pontederia as the Orchid Water-Lily, and from what she says one might infer that Messrs. ——— are trying to deceive the public. Any one who knows this firm knows that there is not a more honest or straightforward concern in the trade, and these criticisms appear to me to be entirely unjust and unfeeling for the public at large are accustomed to associating water plants with lilies, and they are all popularly known as some sort of "lily," and for a popular name "Orchid Water Lily" is perfectly applicable to this plant, and it is just as much entitled to be known as the Orchid Water Lily as *Convallus major* is to be known as the Morning-glory.

Another correspondent comments severely on the popular name which has been given that beautiful chrysanthemum, Mrs. Alpheus Hardy. Now, Mrs. Alpheus Hardy may be good enough for florists, but to ninety per cent of the amateurs who buy seeds and plants, that name has no meaning, while "Ostrich Plume," in two simple words, presents this plant to every lover of flowers in a way that will make them desire to possess it. [Pity it had not occurred to the introducer when naming it.—Ed.] The name is in no way deceptive, and is a most happy one to associate with that plant. The beautiful,

wide, incurved petals, covered with a feathery hair, suggests an ostrich plume more than anything else, and from the public at large as much thanks are due to Messrs. ——— for associating it with this name as there is to the party who introduced the plant; and it is as much entitled to be known as the "Ostrich Plume Chrysanthemum" as *Tropaeolum canariensis* is to be known as the "Canary-bird Flower." The public at large who cultivate flowers, demand popular and descriptive names, as far as possible, and I have never known a seedsman or florist who did not cater to this taste to succeed in building up a very large retail business.

JOHN LEWIS CHILDS.
Floral Park, N. Y., April 5, 1890.

[We believe there are no differences in these matters that could not be readily adjusted were all catalogue men disposed to meet half way the views of the best authorities on the subject. If the Society of American Florists, as a body, does not approve of the printing of the names and the naming of plants as done by certain catalogue men, it is much to be regretted that they do not meet with and win them to other views, if correct, otherwise we must believe that the highest aims of the committees of that body are good and conducive to the honor and welfare of the craft.]

If any one can give good reasons for the re-introduction of an old plant under a new name, before unknown, in large type, placing the true name in very obscure letters with it, our columns are open to him. We hold that no such name, if used at all, should be in larger type than the true and original one.—[Ed.]

Mrs. Alpheus Hardy.

SVN. "OSTRICH PLUME CHRYSANTHEMUM."

I think the communication in last issue from John N. May "strikes the nail square on the head," as to giving Mrs. A. Hardy two names. Call things by their right names thereby saving much confusion and not a little trouble. I think the committee on nomenclature can not report too soon or too strongly on this matter. It is deserving of every one's attention.

G. W. M.

—Isn't Mr. May crowding the pure souled catalogue men too far? It isn't so very long ago that a brand new name was given and the right one consigned to oblivion entirely. Now they are beginning to give the right one in brackets with the other. Surely this is progress. Hadn't we ought to train our guns on those who still follow the old plan of cutting loose entirely from the right name, rather than jump with both feet upon those who show an inclination to at least preserve the identity of the plant to those who have eyes with which to see and read?

A. M. B.

Hybrid Rocheas.

We owe to the kindness of Mr. Pynaert, of Ghent, the opportunity of figuring some hybrids said to be the result of crossing *Rochea coccinea* and *R. jasminica*. They were raised by M. Foncard, of Orleans, and received a first class certificate from the National Horticultural Society of France. The colors show all stages between those of the parents, ranging from white, flushed with rose, to deep crimson. The easy culture of these plants, and the beauty of their flowers, render them "plants for the million." They are particularly well suited for window culture. They are of dwarf habit, and may be kept pinched-in to form a close, bushy habit. They are easily propagated by cuttings, and we are assured, flower the same year as they are struck. A well-drained, rich, loamy soil, with a little leaf-mold and sand intermixed, suits them.—*Gardeners' Chronicle*.

Clematis "Paniculata."

Mr. Wm. Falconer's admirable article on herbaceous plants in your issue of March 1 has just been brought to my notice. In it he takes exception to the name "paniculata" for the clematis that has hitherto been sold as such. As I am in a measure responsible for all that have been sold under this name and as this fine plant is about to be distributed in quantity, it is imperative that the correct name be attached. Our original plants were imported from Japan some 10 years ago, where according to Thunberg, it occurs in the neighborhood of Nagasaki, and Thunberg is the authority for the name *paniculata*, though there are three synonyms, namely, *crispa*, *biternata* and *Vitalba Japonica*; but our plant corresponds exactly with all published descriptions of *C. paniculata* that we have access to, namely, DeCandolle's *Prodromus* and Nicholson's Dictionary of Gardening.

Mr. Falconer in the article referred to,

says "Paniculata isn't the name of the kind that is sold under this name, but no matter, this clematis, one of the fleecy white ones, is indispensable for September flowers, so get the plant and never mind the name." Now, will Mr. Falconer as a member of the S. A. F. committee on nomenclature kindly say what is the correct name? It may not be out of place to remark here that this question of nomenclature is one that is in urgent need of the attention of the society, though it is hard to see just how it can be properly carried on without the assistance of an extensive library and herbarium; the plant under note is a case in point.

Mr. Falconer told me that he raised his plants from seed, this I have never been able to do; our own plants show considerable variation, one is much more robust than the other, and a third received from Jackson Dawson under the name of C. robusta resembles the others in every respect except in that it is not so hardy, for when grown with our own plants it has all its buds above ground injured, while the others, even in February, had commenced growth and many are now in green leaf.

Mr. F. says truly that the plant is indispensable for September work, local florists are much pleased with it, for it is possible to cut sprays a yard long laden with Hawthorn-scented flowers and these are followed by prettily awned seed vessels that remain a long time on the plant. Another good point in its favor is that being a species it is not liable to the clematis disease as are the hybrid kinds, our once extensive collection of these being completely exterminated by the ravages of this disease.

Passaic, N. J.

E. O. ORPET.

Is Primula Obconica Poisonous?

In your last issue H. says that *Primula obconica* poisons his hands whenever they come in contact with the plant. I have had the same experience with *Primula sinensis*, but I have never heard that it has affected any one else in the same way. If primulas are poisonous we certainly ought not to sell them to our customers. C.

—I wish to add my testimony to that of B. in *FLORIST* April 1, in regard to *Primula obconica* being poisonous. Some time since I saw a note in an English paper to the effect that it was very poisonous. As I had been troubled with poison on my hands ever since I have had *P. obconica* in the house, I decided to take note of it, and I am very sorry to say that every time I handle the plant or flowers of it my hands will show it in a few hours, and in a very unpleasant and aggravating way. It must be very poisonous, as I am proof against most everything else in the way of poisonous vegetation, even poison ivy has no effect on me whatever. So, with Brother B., I have decided to throw the plants out, although I consider it a valuable plant otherwise. W. L. MORRIS.

Des Moines, Iowa.

—I see in your last issue a communication from "B." I have a number of times felt a stinging sensation like the sting of a mosquito, and a red blotch with an itching sensation, but I took no notice until my wife complained that there was some plant in the greenhouse that stung her hands but she did not know what. The back of her hands and her wrists are full of inflammation and spots so far as her gown sleeves come. I spoke to the

doctor and he thought it was eczema. I have no doubt it is the *Primula obconica*, am sorry for I have sold the product of 1,000 seed, have a few left. So good for cut flowers, but won't have no more if it is poisonous. A.

—*Primula obconica* does poison the hands, and by rubbing the hands on the face or neck a prickly sensation something like the sting of nettles will be felt. I have heard of several persons being poisoned by it, though it does not affect me. At one time I thought that any person who is not affected by coming in contact with our native poison ivy would not be affected by the primula. But I have found that such was not the case. I can handle both, while a person here can not touch primula, but can handle the ivy, and another person don't dare touch either of the plants named.

Rayhaw, N. J.

JOHN W. SALING.

—In answer to B.'s question in April 1 number I would say that the above named plant is poisonous to some people as I have been badly poisoned with it twice. I understand it has been analyzed by Harvard professors and they say it is the down on the flower stem that is poisonous. Have thrown out my stock except three plants and they are not for sale. It came near killing Mrs. Whittet and I am now suffering from it.

Lowell, Mass.

A. WHITTET.

—I find that when I use *Primula obconica* for wreaths or other work that it causes a good deal of itching and burning between the fingers and on the wrists, but by using a little soda it passes off in a few hours. I can not afford to throw it away. Strathroy, Ont.

I. S. CHALONER.

An Interesting Letter.

ED AM. FLORIST:—Your request regarding the crop of carnation flowers is at hand. It would have been an easy matter in this section to keep a record, the crop of flowers being very small with us. The wet season last year in New England was anything but favorable to the growth of the plants; they were housed in a rather poor condition and you may imagine the result. They were simply a failure, nor does it seem that the failure was in our section alone, but spread more or less over the whole country, carnations being scarce everywhere. One of our commission men in Boston was pressed hard and not able to fill his orders, and I advised him to send to the carnation growers west of us. "Why," he said, "that is where my orders come from."

The plants are now looking healthy enough, but do not bloom well and are making but little growth. As a conclusive proof of the bad effect of a wet season, even on light soils, I had last spring from the introducers a number of plants of Tidal Wave. As the plants in the fall did not grow any better than the balance of the lot in the field, I ordered, early in September, another lot from the same firm. In due time they answered that owing to the drought they could not be shipped in good order and would be sent after some rain. It was late in Oc-

tober when I received them and they were planted in the same house with the others. They grew vigorously and the lot, less than a hundred in number, gave more flowers than the 500 other plants in the same house. The result would have been the same I am certain with any other variety. From personal examination and reports from carnation growers in New England I may safely estimate the crop at one third of the average quantity. There is of course the usual exceptions, but have not heard of many where grown on a large scale.

Nor can the result be wondered at, considering the treatment that, with our system of forcing, the carnations as well as roses and violets are subjected to. The plants are in a perpetual state of vegetation, cuttings are taken in mid-winter, kept growing till planted out, then grown again till planted in and then forced for all they are worth, without a single period of rest. No wonder they are affected with so many cryptogamic diseases.

In the course of my correspondence with some of the specialists in carnations in France I have made inquiries about their system of cultivation. They propagate early in the fall, the cuttings as soon as rooted are planted closely in cold frames and kept dormant till wanted for planting out in the spring. But then there is less demand there for carnations in winter, and the plants are used mainly for summer and fall bloom, which is almost the reverse of our purpose here. But still, part of the stock might be reserved for propagation and we may yet be driven to it, as at the rate our carnations are grown they run out in a few years.

I am probably growing a larger collection than is really needed for market purposes; but with a view to testing them I have for several years past secured every variety of promise introduced here and in Europe, and I must admit that for market purposes, as a general thing, carnations of American origin have proved of more value than European ones as regards winter blooming properties, a fact which is substantiated by the growers there as well. Take for instance, Mr. Carle's catalogue (Lyons, France,) out of 200 varieties named (and Mr. Carle is probably the most extensive grower of carnations in the world) well, out of the whole number, only ten varieties are recommended as winter bloomers. Some of his carnations are really superb, as we have good reason to know, but not very prolific as winter bloomers. Let us hope that with the introduction of the new Italian hybrids or *Marguerites*, as commonly called, we may secure more reliable varieties, or infuse better blood into those we have already. For not every florist may take as cheerful a view as a certain brother florist in Boston, who when with a number of us discussing the ravages of the cut worm on carnations and means to prevent them, exclaimed: "Why, that is the best friend we have; only for the worm, carnations would be too cheap."

Needham, Mass. DENYS ZIRNGIEBEL.

American Seedlings.

American florists are coming to the front as originators of new carnations of decided value. In fact the bulk of the popular carnations of the day are of American origin. Among the first to work in this field was Mr. Chas. T. Starr, whose seedlings are well known and we are glad to place on record the following

facts regarding the production of some which have long had a hold upon public favor. The result of his first effort at crossing was the bright scarlet variety Lady Emma, from seed of Edwardsii fertilized with La Purite. In 1878 came the magnificent Buttercup from fertilizing Edwardsii with Astoria, and from the same pod of seed came Venus, Field of Gold and Duke of Orange. Golden Gate, a still more recent yellow is the result of crossing Hinz's White with Field of Gold. The beautiful seedling J. R. Freeman is from a crop of Century on Seawan; this is remarkably fragrant and is the deep rich crimson Seawan illuminated with the brilliant carmine of Century, the combination making a deep cardinal color.

Cost of Production.

In estimating the profits of carnation growing, this season's prices should not be used, as they are exceptionally high, owing to the large number of plants lost last season from the wet summer. As an illustration, I had last season a bed of Hinz's White, 105 feet long and 15 feet wide from which I cut for over a month from 8,000 to 10,000 blooms per week, which consigned to a commission dealer averaged me 40 cents per 100. This season my returns are from \$2 to \$3 per 100. Hence the prices of this exceptional season would not be a fair basis. A. M. H.

Chrysanthemums for Easter.

Chrysanthemums at Easter are a novelty easily obtained and we believe from our own experience would find a ready sale. The manner in which the plants were treated to secure this end was as follows: Young stock from 2-inch pots were set out the first of May and kept growing vigorously, due attention being given to pinching to make them stocky; by the first of August the plants were cut back one half of their growth, lifted and potted in 5 and 6-inch pots, the pots being plunged to the rims in soil or ashes. The plants now made a strong growth and were well set with buds; as soon as the buds were the size of a pea, water was withheld in order to blight the buds and give the plants a short resting season; as soon as this was done a strong growth started from the roots, this was cut off as fast as it appeared, the object being to keep all the strength in the old stem. After the buds are blighted water may be given occasionally, but not at any time enough to start a strong growth. About ten weeks before the plants are wanted in bloom trim them up, removing all dead leaves and branches and give plenty of water, warmth and sunlight if possible; we however, grew quite a fine crop of blooms from plants under a bench where they only received the sun in the afternoon, but they were much longer coming into bloom. The varieties we used for this purpose were Timbale De Argent, Moonlight, Golden Prince, Cullingfordii, Golden Dragon and Pink Perfection.

Chicago, Ill.

R. C. BANCROFT.

New York Notes and Comments.

Lent does not seem to have been so quiet this year as formerly; while the flower trade fell off considerably during the first two weeks of this period it looked up again afterward, and the last two weeks before Easter averaged good prices for the time of year.

Bay Ridge, Long Island, enjoys a particular reputation for Easter stuff, several growers there being specialists in this line. A familiar name in connection with the Easter trade is that of James Dean, who has made this his specialty for years. This year has been exceptionally trying in the trade, and many find themselves belated, in consequence of the dark wet weather, but Mr. Dean is on time as usual. Ten days before Easter his stuff was so well advanced that it was ready for hardening off. One house contained about 5,000 lilies, both longiflorum and Harrisii. These had been forced gradually, without rushing, and at the time mentioned were standing in a house with every light raised, and doors open. Naturally, they would stand being knocked about in a way that would completely spoil softer grown stuff. Under these circumstances Harrisii was as thick, firm and waxy as longiflorum, with a decided advantage in the size of flowers. Mr. Dean's experience is that the Bermuda lily is fully as substantial and durable as the other, if well grown—that is to say, brought on gradually, and then hardened in a cool and airy place.

A quantity of hydrangeas were being hardened in the same way as the lilies. Otaka far outnumbered Thos. Hogg, though a few of the latter are always liked for the white flowers. However, the superior size of Otaka still makes it the more popular. These were almost all plants in their first season, which makes the most salable size. Last year Mr. Dean had the finest lot of large specimen hydrangeas ever grown, but he considers these smaller plants more satisfactory for general trade use.

A house full of genista made a regular bower of yellow bloom. This has become a regular feature of the Easter trade, forming a very salable pot plant, in addition to its decorative use. Well bloomed plants in 6-inch pots are a favorite size. Some fine specimen plants were five to seven years old; they formed regular trees, covered with bloom, and would be highly effective in church work. These genistas were literally out of doors, the house being entirely open. The genistas were grown according to their natural habit, in which the long shoots of bloom are more effective than when pinched into the round head affected by European growers.

Azaleas were of course plentiful; the retail buyers now seem to prefer the natural habit of the plant, rather than the flat regularity of the European form, as it makes a better show in a room. As a rule the varieties grown vary little year after year, a lot of the older sorts seeming to have the preference, but two newer sorts considered good for trade use are Empress of Brazil and Empress of India, both pale mottled pink, semi-double.

In one house Mr. Dean had quite a space occupied by gray many-colored flowers, which he pointed out as something new to many. They proved to be ixias, which have been so little grown in this country that they will be an entire novelty to many, even among clever plantsmen. Like the freesia, they belong to the Iridaceae, and are a native of the Cape of Good Hope. They were first introduced to cultivation in 1757, and the number

of varieties known is close on thirty. The colors are white, yellow, orange, pink, red and magenta, some being one color only, some two. The flower spikes are grown on long slender stems. They last a long time, partially closing at night and opening again in the morning. A bunch of these flowers now before me has been cut six days and is not yet faded. They require exactly the same treatment as the freesia, lasting in flower about two months. Mr. Dean found them better in pots than flats. They receive a good deal of admiration from every one, the uninformed generally asking if they were not some smaller variety of gladiolus.

An entire house full of Astilbe japonica at this place presented such a uniform size that a man might go in blindfold and pick out a dozen plants at random without varying three inches in the size of plants. This uniformity of size seems to be a strong characteristic of Mr. Dean's stuff; everything runs just about even. Outside he has a remarkably fine strain of pansies, both in size and coloring; some unusually good mottled flowers, as well as solid colors. They are raised from home-grown seed. Taken all round, it would be very hard to beat the Easter stuff at this place.

J. M. Keller, also of Bay Ridge, is another who makes a specialty of Easter stuff; he also shows an abundance of fine lilies, hydrangeas and azaleas. Among the latter were a number of large plants of Comtesse de Flandres, perfect in shape and a mass of bloom; they were exceptionally fine. Another thing to be noted was a batch of big pink peonies, which were very decorative. Speaking of peonies, Mr. Keller said that the chief difficulty in forcing the crimson tenuifolia was inability to get the plants. They can only be obtained in any quantity in Holland and are high priced, nor are such roots large enough to be of much use to force.

A fine batch of rhapis were among the palms at this place, but as Mr. Keller observed, the city buyers do not want to look at palms around Easter; flowering stuff takes the lead. A good many hybrid roses in pots are sold in the retail trade; the custom of buying a pot plant of some sort for Easter seems to increase in favor. There is a decided fancy for white flowers, especially among the humbler buyers, but the taste varies a good deal in different localities. Pot bulbs seem very popular, but this has been quite a hard season for them, and a good many growers were not overburdened with good hyacinths and the like when Easter came.

EMILY LOUISE TAPLIN.

Bulbs at Second Class Freight Rates.

The official freight classification of bulbs has long been an uncertain matter with most railroads, although for three or four years past the trunk lines have classified bulbs (value less than ten cents per pound) as second class. This, however, was changed in the fall of 1889, and for the past six or eight months all bulbs and roots have paid first class freight rates. Some four months since we made a strong protest against this change, and by showing this stock to representatives of the official classification committee and presenting arguments in the case, succeeded in securing a new rate which will take effect in official classification No. 7, effective April 15, 1890, as follows:

"Bulbs in packages O. R., P. P., Second."

This will make quite a material saving to the trade, the freight paid on this class of heavy stock being a large item.

J. C. VAUGHAN.

News Notes.

DALLAS, TEXAS.—The Fort Worth Nursery, Seed & Canning Co. intend to build six new greenhouses the coming summer.

BALTIMORE.—Mr. H. Perlich, the Broadway florist and seedsman, met with a serious injury to his right foot on March 14.

FORT SCOTT, KAN.—Easter lilies better than ever before. Cut flowers sold out clean, designs were more expensive and elaborate than heretofore.

ST. PAUL.—Mr. W. C. Cook, until recently with L. L. May & Co., has accepted a position with J. W. North, St. Louis, Mo., and has removed to that city.

ST. JOSEPH, MO.—Mr. Hans Neilson, the florist, was elected alderman at large for the first ward, by the largest majority received by any of the candidates at the recent city election.

LOUISVILLE, KY.—The recent cyclone did no damage of any consequence to greenhouses here. But owing to the damage done to the water works we expect a water famine, which will be harder on the florists than the cyclone.

LOUISVILLE, KY.—Mr. Jos. Coenert will soon begin the erection of three new houses 100x15 each. The Morants will also build, the projected plans being for fourteen new houses, each 100 feet in length, all to be heated by hot water.

SAN FRANCISCO.—Miss Annie Neuberger, only daughter of H. Neuberger, died March 29. The family have the sincere sympathy of the fraternity on the coast, where Mr. Neuberger has been so long and favorably known as a leading florist and grower.

HARRISBURG, PA.—A heavy hail storm smashed considerable glass here early in the morning of April 9. L. E. McClinch took about 650 lights and others in proportion. Very little double thick glass was broken, the damage being almost entirely confined to single thick. No insurance.

CHICAGO.—Mr. Anton Then, the Larabee street florist, has had on exhibition at his store for the last few weeks a well bloomed azalea of unusual size. The plant is four and one half feet in height, twelve feet in circumference and so thickly covered with flowers that no foliage is to be seen. The plant is the single, pink flowered variety Modele, Mailander. Inshcer & Co. have started in at Morton Grove with 30,000 feet of glass, under the title of the Morton Grove Rose Co. The glass is heated by steam. Mr. Mailander is a brother of O. Mailander, of the firm of Schiller & Mailander, at Niles Center.

NEW YORK.—The New York Times of March 29, says: "Charles F. Klunder, the florist, has shaken the dust of his former successes from his feet, and, according to the President of the Klunder Company, has taken about \$4,000 of the company's money without the consent of its officers. He is said to be at present in London, his wife and children being with him. The cause of his downfall, it is said, was racing." William C. Wilson, the well-known florist and nurseryman, of Astoria, who made an assignment some time since, is reported by the daily press to have been acting so queerly of late as to be considered insane from his financial losses.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

SITUATION WANTED—In commercial place by a gardener of 28. For particulars, address H. C. care American Florist, Chicago.

FOR RENT—Greenhouse; good town, 5,000 population; good trade; size of house 19x30. Near the square. Will sell stock and rent house. Water works and electric lights. Cause for selling, illness. CHAS. P. CASKEY, Greensburg, Ind.

FOR SALE—Florist and seed store, with 5,000 feet of glass on three houses, heated with hot water, with a full and complete stock of plants; prominent location in the center of the city, five minutes from depot; and everything sold over the counter. A good trade in the way of making up decorations and funerals. Reason for selling, want to go west. For particulars, address J. W. BAHR, 38 & 40 West Scott Place, Elizabeth, N. J.

FOR SALE—A well appointed wholesale floriculturist's establishment, 32,000 sq. ft. of ground covered with glass, in a lively suburb of New York City. All cut flowers are sold on the premises to wholesale retailers, and the demand for selling is the supply. Excellent reasons given for selling. Price, \$30,000, one-third cash, balance on bond and mortgage. For particulars, address THOS. W. WEATHERED'S SONS, 46 and 48 Marion Street, New York City.

FOR SALE—A grand opportunity to any one about building greenhouses. The undersigned will sell (with or without land) their entire plant stock at great bargain, consisting of about 25,000 feet of glass, 750 feet of ventilating apparatus (Hitchings & Co.), 750 feet of electric pipe, two No. 7, one No. 8, one No. 15 and one conical boiler all in first-class order, and made by Hitchings & Co. Houses only built but a short time. For further particulars apply to J. BROS., P. O. Box 212, South Orange, N. J.

FOR SALE—Two greenhouses, 5,000 feet of glass, fifty miles of New York City, with good stock of plants; an established and paying business. A bargain, for \$2,500. On east terms. Address J. J. McNEIL, N. J. care American Florist, Chicago.

FOR SALE—On account of bad health, I will sell my frame house, greenhouse full of bedding plants, trees, shrubs, with a five year lease. A great opportunity for an active landscape gardener, florist. The stand alone is worth money, being located in the very best part of the city of St. Louis, Mo. Address 4325 Westminister Place, St. Louis, Mo.

FOR SALE—The leading florists business in Topeka, Kan., the Capital and largest city of the State. Demand constantly in excess of supply. Population double that of St. Marys, Pa. Business cultured, and one of the finest cities in the West. Large shipping trade. Most widely advertised and best known florists business in the State. Business flourishing, and can be indefinitely developed by push and energy. Best of reasons for selling. Can be had at a bargain. For cash. Correspondence solicited. Address PAUL M. PIERSON & Co., Topeka, Kansas.

TO LET.

For a number of years, a most desirable florist and nursery establishment on Long Island, N. Y., being an old stand and with low rates of land, private railroad stations, to all the Brooklyn ferries and bridge. The place consists of about 3 acres of very good soil, well stocked with young trees, shrubs, vines, etc. There are about 6,000 feet of glass and a number of cold frames, etc., and a very good and suitable place for growing plants. In the proximity of all the principal cemeteries on Long Island, a good business is done in bouquets and funeral flowers. Only a good, competent gardener need apply. Poor health is the reason. For further particulars apply to H. J. HENRY, Brooklyn, N. Y.

East New York Station, E. Brooklyn, N. Y.

SITUATION WANTED, By a Florist; married; 28 years old; German; 10 years' experience. JOHN WOJTSCHKE, 162 W. 19th St., CHICAGO.

THE AMERICAN FLORIST CO., Chicago.

MR. TH. ECKARDT, Govanstown, Md., sends us a communication regarding the nomenclature of coniferous plants which he describes as in great confusion and suggests that these be added as a division for the consideration of the committee on nomenclature. It occurs to us that it would be unkind to unload any more work on to that committee and believe that we had better wait until further work has been done upon the divisions of plants which are more largely handled by florists, before increasing the numerical strength of the committee. Mr. Eckardt calls attention to the "Handbuch der Coniferen-Benennung," edited by L. Beissner and published by Ludwig Moller, Erfurt, Germany, as a great help, as it contains the list of names adopted by the Congress of growers and lovers of coniferous plants at Dresden, May 12, 1887.

CARNATION FRED CREIGHTON is the name of a new carnation of which fifty specimen blooms are sent us by Mr. Geo. Creighton, New Hamburg, N. Y., the introducer. The flowers are pink incolor, in the way of Grace Wilder, of good size, deeply fringed, very fragrant, with perfect calyx and on stems of generous length. The flowers sent are nearly all that could be desired in a first class pink carnation and if the habit and constitution prove also first class, it will be a very valuable addition to our list of pink varieties.

OUR REPORTS of the Easter trade of 1890 show the usual gratifying increase over that of previous years, as will be noted by a study of the reports. *Lilium Harrisii* is steadily growing in favor while the calla seems to be losing ground to some extent. The use of blooming plants at Easter time is still decidedly on the increase, while loose flowers are called for to the almost entire exclusion of any formal arrangements.

FROM the numerous letters upon the subject we print in another column there can be little doubt that *Primula obconica* is poisonous to many. This is much to be regretted as the plant has proved to be extremely useful, both as a pot plant and in supplying cut flowers. It will be really too bad if we are obliged to banish it from our greenhouses. But this will certainly have to be done if it is unsafe for all to handle.

THE MAN with a secret is still with us. His "secret" is a preparation which is a "sure cure" for the violet disease, and he is willing to divorce himself from it for the modest sum of \$1,000. And still violet growers do not seem to be falling over each other in frantic efforts to get to him first. It would seem as though the market for "secrets" was in a depressed condition.

"SOUTHERN FLORICULTURE, a guide to the successful cultivation of flowering and ornamental plants in the climate of the southern states," is the title of a neatly printed and bound book of 312 pages received from the author, Mr. Jas. Morton, Clarksville, Tenn. Its tone is eminently practical and it will undoubtedly prove of very considerable value to lovers of flowers in the south.

LILIAM HARRISII.—Mr. F. R. Pierson, Tarrytown, N. Y., sends us a photo of one of his new iron houses, 20x140, showing an Easter crop of *Lilium Harrisii*. There is a magnificent show of bloom. Mr. Pierson writes that the house contained about 5,000 pots and the crop of flowers exceeded 20,000.

SEVERAL additional replies to Mr. Ralph's query as to length of time steam boilers may be safely left without attention have been received, but the subject was so thoroughly covered in last issue that it is hardly necessary to give them space.

LONGEVITY OF FERN SPORES.—A correspondent of the *Gardeners' Chronicle* states that fern spores which had been gathered and kept dry for six years have retained their vitality.

OUR NEW TRADE DIRECTORY is now ready. It gives a complete and accurate list of the florists, nurserymen and seedsmen of the U. S. and Canada. Price \$2.

CALLA WITH THREE SPATHES.—The Park Nursery Co., Pasadena, Cal., send us a photograph of a calla with three spathes, each full usual size.

FIELD MICE.—A French publication states that carbolic acid or a small quantity of camphor will keep field mice away.

THE AMERICAN GARDEN in its new form is a splendid specimen of typography and is a credit to American horticulture.

Historical.

The following letter of recommendation given by Henry Clay to his gardener has been sent us by the B. A. Elliott Co., Pittsburg:

"Mr. James George, the bearer hereof, has lived in my family, as a gardener, during more than a year past. He has conducted himself with great propriety, shown himself a skilful and scientific gardener, and has interested my family very much in his welfare and prosperity. I should be very happy to retain him in my service, but the times are such as to render it inconvenient to me to pay the wages to which, by his merits, he is justly entitled. He has my best wishes for his success in life, wherever he may go."

Ashland, 25 Nov., 1843. H. CLAY."

—The following purports to be a copy of an agreement between George Washington and his gardener, and is both interesting and amusing:

"Articles of agreement, made this 12th day of April anno Domini one thousand seven hundred and eighty-seven, by and between George Washington, Esq., of the parish of Truro, in the county of Fairfax, State of Virginia, on the one part, and Phillip Bater, gardener, on the other. Witness that the said Phillip Bater, for and in consideration of the covenants hereinafter mentioned doth promise and agree to serve the said George Washington for the term of one year as a gardener, and that he will during said time conduct himself soberly, diligently and honestly; that he will faithfully and industriously perform all and every part of his duty as

a gardener to the best of his knowledge and abilities, and that he will not at any time suffer himself to be disgraced with liquor, except on the times hereafter mentioned. In consideration of these things being well and truly performed on the part of the said Phillip Bater, the said George Washington doth agree to allow him (the said Phillip) the same kind and quantity of provisions as he has heretofore had; and likewise annually a decent suit of clothes, befitting a man in his station; to consist of a coat, vest and breeches, a working jacket and breeches of homespun besides; two white shirts; three checked do.; two linen pocket handkerchiefs; two pair linen overalls; as many pairs of shoes as are actually necessary for him; four dollars at Christmas with which he may be drunk four days and four nights; two dollars at Easter to effect the same purpose; two dollars at Whitsuntide to be drunk two days; a dram in the morning and a drink of grog at noon."

The document is signed by the two contracting parties and witnessed by George A. Washington and Tobias Lee.

—Mr. Geo. Classmann, Sing Sing, N. Y., sends us the following regarding New York in 1693, taken from Wm. L. Stone's "History of New York City":

"Every house in New Amsterdam was surrounded by a garden, sufficiently large to accommodate a horse, a cow, two pigs, fowls, a patch of cabbages and a tulip bed. Indeed, the love of flowers seems to have been inherent in the Dutch dames. While the head of the family carefully watched the growth of some ancient household tree, planted in accordance with a universal custom in New Amsterdam, directly before the doorway, the matron might have been seen with her little painted basket of seeds in her hand, going to the labors of the garden. Nor is this figurative. It was the universal custom for a Dutch lady in independent circumstances, gentle of form and manner, to sow, plant and cultivate. These fair gardeners were also good florists. Where have there ever been found choicer hyacinths and tulips than among the Hollanders?"

—We have received a copy of what was probably the first catalogue of plants for sale published in the city of Chicago. The title page reads: "Spring of 1858. Catalogue of Plants, cultivated and for sale by Edgar Sanders, Lake View, Chicago, Ill." It contains but four pages and two of these hold the list of plants. Three-fourths of the first page is devoted to verbenas, the remaining one-fourth to geraniums and fuchsias. The other page contains a list of miscellaneous plants. The long list of named verbenas shows the popularity of this plant at the time.

A Tariff on Plants.

You are probably aware that the new tariff proposes to levy a duty of 20 per cent on all plants. This is aimed against the importation of cheap nursery stock from Canada, Holland, France, etc., but will seriously affect the florists of the country in their annual importations of assorted stuff. Orchids, palms, fancy roses and many other articles for which America has to draw upon Europe will be taxed without a good cause; even lily of the valley, spiraea, iris and similar herbaceous plants will be affected. Is it not time to sound a warning through your columns to those who think they should protest with the Committee on Ways and Means against the measure?

☞ Seed Trade.

SEED TRADE ASSOCIATION.

H. W. JOHNSON, Philadelphia, president; ALBERT M. McCULLOUGH, Cincinnati, secretary and treasurer. The eighth annual meeting at Saratoga Springs, N. Y., June, 1896.

LATER reports locate Mr. A. B. Cleveland in Melbourne.

MR. ALFRED HENDERSON is somewhat improved in health, he is still at Richmond, Va.

IT IS STATED that Mr. C. N. Jordan, formerly connected with the U. S. Treasury Department, will take charge of the A. B. Cleveland Co.

MR. SIDNEY WILKINSON, for some years with Henry A. Dreer, and formerly with Michel Plant and Seed Co., died at his home in Philadelphia March 28, of typhoid fever. Mr. Wilkinson was an able seedsman and office man.

MRS. CHAS. P. BRASLAN died at Minneapolis March 26. The funeral services were held at Boston, Mass., April 2, and the interment at Mount Hope cemetery. Mr. Braslan has the sincere sympathy of the entire trade in his great loss.

A CHANGE in the duty on peas, beans and barley to 40 cents per bushel and a change on garden seeds from 20 to 30 per cent and a rate of 30 per cent placed on agricultural seeds, has been favorably reported to the U. S. Senate, and is reported as likely to pass both houses. This continued tinkering with the tariff can not be beneficial to the trade.

A "Model" Seed Catalogue.

A New England paper among many notices of seed catalogues, contributes the following which we produce for the benefit of the trade with some slight omissions of names and figures:

"We have already had a good deal to say about the seedsmen's catalogues for 1890, but to our great pleasure we have now occasion to say the best 'good word' of all. We are led to do so by the receipt of a catalogue which is at once original, readable and beautifully illustrated. This is the handsome annual of John Thomas Model, of —, —, —, a seedsman who has customers at more than — postoffices, and can certainly afford to publish the leading catalogue of the year. There are others on our table, and some others under the table, that are filled with more bombast, gas, colored plates, and indescribable nonsense concerning nine hundred and ninety-nine 'novelties' and 'new sorts.' But we find nothing of the kind in Mr. Model's. It is highly original and an ideal publication of its kind; and it is readable, which is more than can be said of the average catalogue. Indeed, we are much inclined to think that the ordinary catalogue is rarely read, and Model's, moreover, is instructive and interesting. There are 96 pages of good solid matter, and not in one single item does the seedsman 'slop over.' He has good seeds, and he tells about them in an honest, candid and straightforward manner, without any flash or pretense of any kind. * * * * *

Turning the catalogue over we find below the title, 'The Wonderful Bush Lima, the Novelty of the Season,' named and graphically pictured. The pods shown are true to nature, and the contrast between the picture of a happy youth who is bending over the bushes from which he is picking, and that of a man who stands tip-

toe on a barrel picking from a pole, is suggestive and full of truth. Opening the book we are happily surprised in missing the colored plates of exaggerated character with which some of the other catalogues are 'adorned.' On the inside covers are some very fine illustrations of vegetables in the natural colors, and all through the book the cuts are remarkably excellent. The catalogue opens with the plain and honest statement, 'I am prepared this season for the largest business ever done in Model's seeds.' The contents prove the truth of this declaration.

We have not space to include all that is worth quoting in the book; but to give an idea of the sterling ring [sterling ring is good] of the man's tone, we wish to quote the introduction entire, adding that every word that is said can be depended upon as being strictly true to the facts.

He says: 'To tell the truth I already stand on the top round of the ladder in more things than one, and I have my customers alone to thank for this grand result.' * * * * * There are no 'novelties' to lead off, and there are not so many varieties in the list as some other seedsmen give, but the list is unsurpassed in that it contains only the best of everything, all surplus and doubtful varieties left out, and nothing that is worthy omitted. The descriptions are condensed and simply tell the truth. We can not find that in any instance the same variety of seed has been offered under half a dozen different names, or that some worthless varieties are put out under new names. 'I guarantee my seeds to be just as represented,' Mr. Model says; and he means it too. There are departmental descriptions of vegetable and farm seeds, of flower seeds, of thoroughbred pigs, of poultry and of gardening tools. There is no loud trumpeting, exaggerated illustrations or other humbuggery about it. There is no blazoning of cheap prices—which being interpreted, means cheap seeds. Model's seeds are never cheap in any sense."

As Mr. Hallock says, "There are solid chunks of wisdom" in the above.

Temperature of Water for Plants.

Experiments have been carried on for many weeks under the instructions of M. J. Dybowski at the school of Grignon and at Paris, with the view of testing what is the best temperature at which water may be applied to the roots of plants grown in pots, or whether plants are in any way influenced by the same. Different batches of plants were put under exactly similar conditions, and while some were supplied with water at the same temperature as the surrounding air, others received water heated successively from 2° to 50° higher. The results of the experiments have simply been nil, with the exception of verifying that the temperature of the water makes no appreciable difference either in stove or greenhouse culture. M. Dybowski explains the results by saying that water put in contact with soil rapidly takes the same temperature as the latter, and by the time it reaches the roots of the plants it is in equilibrium with the soil at the bottom of the pot.—*Gardening World*.

Japan Lilies.

Some idea of the enormous quantity of lily bulbs that are annually grown in Japan for export may be gathered from a report given in *Semperirens*. This report states that during the months of August and September last there were

shipped from the only port of Yokohama, 722 cases for Hamburg; 5,079 cases for London; 456 cases for San Francisco; 223 cases for Singapore; 120 cases for Hong Kong; 112 cases for New York, and 61 cases for Bombay. In October one house alone sent out 419 cases of lilies. The greater part of the above consists of *Lilium auratum*. The numbers of this fine lily that are annually killed, destroyed or lost must be very great.—*Gardening World*.

GREENCASTLE, IND.—Mr. John Wilson, the superintendent of Forest Hill cemetery here, has accepted a similar position at Marion, O. Mr. Wilson has done more to improve the grounds of Forest Hill cemetery than any of his predecessors and was a faithful officer. A host of friends will regret his departure.

Stevens' Florists' Refrigerators

These are the only ones made that will keep Cut Flowers perfectly. The Reason: Because, the temperature is always even. The air is perfectly dry. They are never cold and warm, as the ice may be much or little in them. This is why they do their work perfectly. They take but little ice, and no care.

GEORGE HEINT, Esq., the leading florist of Toledo, under date of March, 1891, says: "The artist refrigerator you put in for me two (2) years ago has been in constant use summer and winter ever since. Keeps cut flowers nicely from three (3) to seven (7) days, can then be taken out and will keep as well as ever. Uses but little ice. Cost me less than four dollars (4) the hottest month. It will pay for itself easy in the stuff it will save in one season. I would not be without it for double its cost. I never lose any flowers, as they keep until sold. Resp."

They are ornamental, can set in any place. Have glass doors in front to show goods. The style and workmanship can be depended on. Circulars sent on application.

SEND IN YOUR ORDERS.

The new book is a very great advance upon the old one, as we have covered the whole country by correspondence and obtained original lists of those in the trade in every city and town in the United States and Canada. We believe that the list is now as nearly correct as it is possible to get it.

AMERICAN FLORIST CO., 54 La Salle St., CHICAGO.

Preserving Fragrance of Violets.

In answer to the query as to how best to keep the fragrance of violets, which appeared in last issue, would say: I pick the violets, bunch them, put them in pots of water and stand them in the cellar for three or four hours before shipping them. When time for sending away arrives they are packed carefully in boxes lined with wax paper. None of my customers have ever complained that the violets lost fragrance before reaching them.

CHARLES PICK.

Cedar Stakes.

I would like to ask through the AM. FLORIST what there is in cedar wood that will hurt fuchsia plants? I bought some cedar shingles, split them up for stakes and used them to stake my fuchsias. In a few days where the young wood and leaves touched the stakes they looked as though they had been burned. Has any other florist had a similar experience?

E. G.

Lilium Harrisii Bulbs

THE BERMUDA EASTER LILY.

Having made arrangements to handle the entire product of several of the largest growers of the Harrisii Lily in Bermuda, we are prepared to offer the trade at extremely low prices, the finest stock of these bulbs ever brought to the States.

Careful personal inspection of the growing crops assures us that the bulbs offered are entirely free from blight and mixture, and that they are 1st class in every respect. If in the market for these bulbs, write us stating quantity and sizes wanted, and we will quote prices by return mail. Bear in mind that on orders sent us AT ONCE the bulbs can be shipped in time to force for the CHRISTMAS HOLIDAYS if desired.

The "PLANET JR." SEED DRILLS WHEEL HOES HORSE HOES

The "PLANET JR." No. 2 GARDEN DRILL, is beyond question the best; sows the most difficult seeds; opens, covers, rolls down and marks the next row with the greatest regularity. The COMBINED DRILL and HOE, &c. The greatest favorite ever produced. Perfection as a Seed Drill, or as a Flow, Hoe, Garden Rake, Cultivator or Marking. Saves labor and seed and soon saves cost. The DOUBLE WHEEL HOE. A money maker for farmers and gardeners. Works both sides of a row at once. Plows to or from, opens, throws, covers, cultivates, hoes, rakes and has lost guards. The SINGLE WHEEL HOE is a treasure. Bents the double in some crops; is lighter. Has a Large Flow, two Long Hoes, two Rakes, three Cultivator Teeth, and a Leaf Guard. The FIRE-FLY SINGLE WHEEL HOE. Equals the best, except has no rakes nor leaf guard. The FIRE-FLY GARDEN PLOW. Worth its price yearly in a garden 20x40 feet. The GRASS EDGER. The newest, neatest, cheapest and best machine known for edging paths and flower beds. The 1890 HORSE HOE. The finest tool and most costly to make that we have ever offered. Yet the result justifies our care, as every one who sees the tool will admit. The first grand improvement is our new patent Lever Expander, one all farmers admire and which they will pay \$25.00 for, to put on old machines. The next feature is our patent Handle Shifter, enabling one to walk to one side of his work, worth \$3.00 a day for some crops. Yet we ask but a small additional price for both these fine features. Why not send for full descriptive catalogue of these and all our other S. L. ALLEN & CO. Patentees and Sole Manufacturers. useful improvements? Free to all. 1107 Market St. PHILADELPHIA, PA.

Indianapolis.

The fourth annual chrysanthemum show by the Society of Indiana Florists will be held in this city November 11-15. An advance sheet of premiums will be sent out this month.

The membership of the local club is growing. At the last monthly meeting a paper on greenhouse construction was read by John Baker, assistant florist at the Deaf and Dumb Institution.

Bernie Fohl added a house 125x30 for growing roses; Anthony Wiegand is adding a house 150x14 for spring plants; Alfred Lahud a house 60x20 for plants.

Natural gas has been a terror to decorative plants this winter; in some dwelling houses, besides being very dry, the temperature was kept up to an unbearable degree.

The winter season's trade altogether did not come up to the year before. Society people were very quiet, and in addition a great many leaders were transferred to Washington and foreign cities. A good spring trade is expected, however, with a good Easter trade to start with.

John Hartje, an enterprising young florist, has bought property and will build houses to grow specialties for the wholesale trade. W. B.

"I have a stock of the Star Spangled Banner Plant, whose glorious star-shaped flowers are red in the morning, white at noon and blue in the evening, and —"

"Sir, this is the office of the Horticultural Atomizer. No such plant as you describe can possibly exist. It is a humbug sir."

"I should like to advertise it in your periodical; five inches double column space, top of page, next to reading matter. Am willing to pay extra for that position."

"Glad to see you sir. Take a seat. We go right to the people you want to reach. How many times do you want the adv. to appear?"

O. P. C.

2-inch Pipe.

In the March 15 issue I see an article on the use of 2-inch pipe written by R. S. B., of Kansas City, Mo., in answer to which I wish to say that 2-inch pipe will do the same work as 4-inch pipe if attended to as required.

It is true that 2-inch will heat quicker and get cold quicker than 4-inch, but bear in mind that 2-inch are only one half the size of 4-inch, and my opinion is that wrought iron pipe does not retain heat as long as cast iron pipe. It is not true that 2-inch pipes are worthless. I have used 2-inch myself and can say they are not worthless. I think a 2-inch cast iron pipe would be a good thing to take the place of 2-inch wrought iron pipes. My opinion is that a 2-inch cast iron pipe with a flange union like a collar would be a useful pipe, and it seems to me could be cast very easily. Such would give a great advantage over the old style pipe and beginners would buy them rather than 4-inch, to my notion. The collar should be made the same as a flange union, with four holes for bolts; a washer or packing ring should be used between every joint. They can be easily put together by any one and no expensive tools will be required. I would like to hear from other florists on this subject.

DO YOU SAY
You have not tried HUGHES' SOLUBLE
FRUIT TREE OIL,

And that you want an effective Insecticide, then do what other florists of experience and wisdom have done before you, and order at once a trial gallon. Read the previous numbers of the FLORIST to find out what it will do. Dozens and dozens of American testimonials have confirmed what I claim for it.

E. GRIFFITH HUGHES,

BOXES. BOXES. MAILING AND CUT FLOWER BOXES.

Read what C. A. Reeser says for our 3-Piece Box:
GENTLEMEN:—I write to tell how well pleased I have been with the mailing boxes you have furnished me during the past two years. I think I have ordered 35 or 40 thousand, thus giving them an extensive trial. I think there is nothing in the market that is so satisfactory, at least, that has been my experience, and I have tested nearly, if not quite all the boxes in the market for that purpose.

Yours very truly,
C. A. REESER.

GREENHOUSE HEATING.

BY A. B. FOWLER.

Explains fully all the best systems of heating greenhouses by both hot water and low-pressure steam. Tells you the points to consider in selecting an apparatus. How to adjust same to various locations; gives the results of the latest scientific experiments. Shows how to compute the number of feet of pipe required for a given space; draft and other important matters. It is highly commended by Mr. John Thorpe and others. Postpaid, 75c.

Sent on receipt of price. Address,
AMERICAN FLORIST, CHICAGO.

Some Decided Novelties.

The following, taken from the *Newburgh (N. Y.) News*, brings to light some remarkable novelties and we hasten to place them before the trade.

The florists of this city are now having a very brisk trade in the way of flowers for Easter—both wholesale and retail dealers—and their places of business are now daily filled with the choicest cut flowers, including hydrangas in variety, Easter lilies (lilium hersii), etc.

The real Easter lily is "St. Joseph's," a short white flower, bell-shaped. There are also the calla lily (Lily Ethopica), the Astelia Japonica (Encelis Amazonica), lily of the valley, etc. Following these come the Kondechelle specuoe, smilax and Eugen Vellie. Spectabilis, a showy purple flower. Among the roses on sale are the Cornelia Cocks, a white rose high-priced; the Generale Jackimotte, and the pink and high-priced La France Merit, the souvenir de Mel-nasson, a light plush and sweet scented rose, very scarce; the Peulneyron, a large pink rose; the Annie Dishack, another fine pink; the Baron Roehschild, a flesh-colored rose, shading to white; the Bon solent, a bronze pink; the Pearl of the Gardens, a yellow rose; and the well known Marechal Neil. Then there is the Peppie Gunther, a beautiful red rose. This rose came out in New York about eight years ago, and William Francis Bennett, a Philadelphia, bought the whole lot of the dealer for \$5,000, and propagated them, selling them to florists for \$1 each, when in turn the florists cultivated them, and now they can be purchased for them 25 cents to 30 cents each, and they are in great demand. Another rose, called "Poppy Graham's Pride," has a changeable color, the petals sometimes having a bluish hue, changing to grass green at full bloom.

We are rejoiced to know that Mr. Bennett is at present located in Philadelphia; he always did enjoy good health at Den-nison Bros., and we presume he is now located there "permanently for the present," as one of our esteemed acquaintances would put it. But it does seem strange that such a valuable new rose as "Peppie Gunther" never came to our notice, though introduced eight years ago. We tremble to think that we might never have known of its existence had it not been for the above named paper. We commend the new rose "Poppy Graham's Pride" to the attention of the more modest and retiring of our catalogue men. The unique and effective description should give it an extensive sale among lovers of startling floral novelties.

Supplement to THE AMERICAN FLORIST.

Vol. V.

CHICAGO, APRIL 15, 1890.

No. 113.

Increase of Duty on Plants.

The McKinley Bill which was to be favorably reported by the Ways and Means Committee in the House of Representatives April 14 increases, as we are credibly informed, the duty on much florists' stock, among which we may mention roses, lily of the valley, palms, spirea, orchids, azaleas, etc. It is believed that the favorable report of this committee will go far towards securing its adoption and those who desire to protest against this increase should take prompt action. Presuming that many of our readers may wish to do this we attach a blank herewith. Every florist who wishes to defeat the bill should tear it off, fill out with the name of his own Congressman, and mail it to him with or without a personal letter.

 **TEAR OFF THE LOWER PART.**

TO THE HON. _____ M. C.

_____ Congressional District,

State of _____,

We would respectfully protest against the passage of that part of the bill now pending before the House of Representatives and known as the "**McKinley Bill**," which provides for an increase of duty on roses, palms, orchids, spirea, lily of the valley, azaleas, or any other stock for florists not commonly produced in this country in competition with foreign countries, and many of which can not be grown to advantage here owing to climatic and other conditions.

A thoroughly Portable Span Roof Greenhouse, 12x8 feet, with Boiler House 4x1 feet, Heating Apparatus and Ventilating Rods included, put up complete (freight prepaid) within 10 miles of New York City for \$325.00, or delivered on car in New York for \$260.00, and any gardener or ordinary mechanic can erect it in one day.

Greenhouse Heating AND Ventilating

HITCHINGS & CO.

233 Mercer Street, New York.

Five Patterns of Boilers,
Eighteen Sizes,
Corrugated Fire Box Boilers
Saddle Boilers,
Conical Boilers,
Base Burning Water Heaters

Perfect Sash Raising Apparatus.

Send 4 cents postage for Illustrated Catalogue.

Patent Improved PORTABLE BOILERS

FOR HEATING

Greenhouses, Graperies, Conservatories, Forcing Pits, Propagating Houses.

Smith's Improved Ventilating Apparatus, for opening and closing Ventilating Sash, on roof or sides of Greenhouses and Graperies.

Price List furnished on application to

DAVID SMITH,
86 Beverly Street, BOSTON, MASS.

Reduce your Coal Bills THE FURMAN STEAM HEATER

ESPECIALLY ADAPTED FOR WARMING GREENHOUSES. Gives a most uniform heat night and day. Can be run with less attention, and a SAVING of fully 20 to 25 Per Cent. in Fuel over any other method. Burns HARD or SOFT COAL. Endorsed by leading Florists. Send for full Illustrated Catalogue, showing how to pipe and heat a house by steam.

Address HERENDEN MANUFACTURING CO., GENEVA, N. Y.

HIGHEST AWARDS and MEDALS have been given the FURMAN BOILERS at all the Large Expositions of this Country. Made in two Styles, as MAGAZINE BURNERS and SURFACE BURNERS, and in two forms, both PORTABLE and BRICK-SET.

16 SIZES FOR STEAM. 16 SIZES FOR WATER.
CERTIFICATE OF MERIT Awarded by Society of American Florists, Buffalo, N. Y., August 1889.

Send for our new books showing what prominent florists say about our boilers.
Address THE HERENDEN MFG CO., 26 Vine St., GENEVA, N. Y.

DAS GARTNERISCHE UNTERRICHTSWESEN is the title of a 90-page book in paper covers received from the author, M. Herb, Erfurt, Germany. It is in the German language and the title will undoubtedly give an idea of the contents to our German readers.

OUR NEW DIRECTORY of the florists, nurserymen and seedsmen of the United States and Canada is now ready. Price \$2.

A CARMODY BOILER

Will Cost less, Use less Fuel, and has more advantages than any other Boiler in the market.

Send for Descriptive Catalogue.

OUR NEW trade directory is now ready.
Price \$2. Order a copy now.

WE ARE under obligations to many growers for records of bloom cut and will soon be able to present some valuable statistics regarding the average number of blooms cut from certain varieties of roses and carnations.

OUR SUBSCRIPTION list continues to show a slow but steady increase. We have now practically every florist on the American continent on our list and a surprisingly large number of subscribers in foreign countries. The FLORIST now goes to every civilized country on the globe.

S. A. F.

Preparations for the Boston Meeting.

THE TRADE EXHIBIT.

The customary trade exhibit in connection with the annual meeting of the S. A. F. will be held in lower Horticultural Hall; in accordance with a vote of the executive committee of the National Society, a uniform charge of twenty-fiv cents per square foot for floor and wall space occupied will be made to each exhibitor, regardless of the nature of the goods shown. The allotment of space and all other details connected with this exhibition have been turned to a committee of the Gardeners' and Florists' Club of Boston. This committee is now prepared to receive applications for space. Applicants will please state fully the nature of proposed exhibits, with number of square feet required, and whether floor or wall space is preferred. Owing to the limited room available, the committee reserves the right to restrict or refuse space at their discretion. All applications should be in the hands of the committee not later than July 15. The different exhibits will then be classified and space allotted. The committee is composed of the following gentlemen: Wm. H. Elliott, Chairman; N. F. McCarthy, Secretary; J. J. Cunningham, E. A. Wood, John Walsh, Samuel Neil. Address all communications to N. F. McCarthy, 1 Music Hall Place, Boston Mass.

HOTEL ACCOMMODATIONS.

Boston being on the direct line of much of the summer travel, August is the busiest month of the year with most of the hotels. Reduced rates are, therefore, out of the question, and delegates will do well to make early applications for accommodations required. An additional uncertainty in this connection is caused by the meeting of the G. A. R., which takes place in Boston but one week ahead of that of the florists. It is probable that many attendants at the G. A. R. meeting will remain in the city during the following week, and the committees having in charge the matter of hotel accommodations for the S. A. F. has found it a difficult matter to get any encouragement from many of the larger hotels. The Quincy House promises to take care of from 500 to 700 delegates. The American agrees to take 300. All the others, regardless of size or location, make a limit of from 25 to 50, a few going as high as 75. The following list is arranged according to distance from the convention hall, beginning with the nearest. Where two rates are given, the lower rate generally applies to rooms occupied by two persons.

The committee on hotel accommodations is composed of the following gentlemen: Wm. J. Stewart, 67 Bromfield street, Boston; M. H. Norton, Berkeley street,

Boston; P. Welch, 165 Tremont street, Boston; J. Frank Curtis, Newtonville, Mass.; J. J. Cunningham, Readville, Mass. Applications sent to either of the above addresses will receive prompt attention.

HORTICULTURAL EXHIBITION.

The Massachusetts Horticultural Society will hold during the week of the convention a grand horticultural exhibition. This will be arranged in a mammoth tent on Boston Common, a short distance from Horticultural Hall. In many respects this will be the most notable exhibition of the kind ever made in America. Competition for the premiums is open to all, and contributions of specimen plants or rare flowers from all parts of the world will be gladly received and properly cared for. Schedules of premiums and all information regarding this exhibition may be obtained of Robert Manning, Secretary, Horticultural Hall, Boston, Mass., or P. Norton, Chairman Committee of Arrangements, Horticultural Hall, Boston, Mass.

New York Notes and Comments.

The impression that Papa Gontier makes the greatest success in a cool and airy situation is endorsed fully by Rudolph Asmus, who expresses a good deal of admiration for this rose. In fact, he intends to discard all his Bon Silene in its favor. Grown in an ordinary sloping house he finds that the best Papas come on the top bench, where they get a full allowance of cool air, while having heat enough to advance rapidly. In a really

cool house, while the flowers are fine the crops are hardly rapid enough for most commercial growers; for this reason it seems as if the top bench in an ordinary house was best, where they have cool air and light. In most cases *Papas* average a degree higher in price than *Bons*.

A good many of Mr. Asmus' *Perles* will go out to make way for *Mme. Hoste*, which is likely to be very largely grown next season; it appears to be generally liked.

Mr. Asmus has been very successful with his *Beauties* this year, they show plenty of healthy wood and consequently fine flowers. Like every one else, he finds that this rose makes tremendous shoots, without any immediate promise of bloom. Believing, however, with the poet, that "all things come to him who will but wait," he ties the long shoot down, and then brings it up to a reasonable height; if it continues to grow he ties it down again before it shows flower, but he invariably gets a flower on these long shoots, and it may be remarked that they are always the finest and most perfect blooms. Some of these tied-down shoots noted were at least twelve feet long, and of course there were new shoots breaking all along it. But the invariable excellence of the flowers on the long shoots was noticeable; it appears to be the natural growth of the plant.

Cusin is a rose always well grown at this place, Mr. Asmus calls it his favorite, and it must be generally liked, for in spite of predictions to the contrary it fully holds its place year after year in public favor. It has the advantage of lasting better than any other rose of its type, in spite of its apparent delicacy. As seen here, it always does best on side benches, where it gets sun on the soil, but comparatively little overhead. It is a rose which is apt to burn more or less without a good deal of care.

Noticing a space given to the ordinary scented geranium, it was said that there is now quite a steady demand for this old thing. It is cut in large sprays, not just loose leaves as they were shipped years ago, when its chief use was as backing in designs. Now that loose flowers are so much called for, the sprays of geranium come in very well to lay under the flowers, and the fresh odor is liked by most people.

Carnations are not much grown at this place, but like everyone else, Mr. Asmus was disappointed with these plants during the past winter. Success in carnations has been a novelty in this district during this season.

Alegatrice is complained of as being too late; Brilliant, declared by many to be identical with *Portia*, is far more satisfactory.

Mr. Asmus was potting a lot of *pæonies* (*P. officinalis*) just imported, which were to be grown on for next season's forcing. This variety is regarded as excellent for forcing.

Among commercial places in the upper end of New York City, David Clarke's establishment is decidedly interesting. His business chiefly takes the form of decorating; consequently his stuff is usually of that type—palms, ferns, and other showy plants. In a lot of decorating plants going some distance out of the city were a number of variegated *acubas*, which make a handsome contrast with their firm and glossy leaves, and will bear any amount of knocking around. They are found very useful in sub-tropical bedding, and the smaller plants are used by the city trade in filling vases and window boxes.

Aralia Sieboldii variegata is another handsome decorative plant which will bear rough usage; the habit is extremely graceful and distinct. Another thing used by Mr. Clarke for its foliage is the European bird cherry (*Cerasus Padus*, is it?), which has firm, glossy, dark green leaves, very like a laurel. All these leaves make an admirable variation with palms and ferns. The bay tree is another fine looking thing similarly used, and it makes such a handsome head of glossy leaves. *Araucaria imbricata*, noted in a cool house, would attract attention by its spikiness chiefly, but it has a beauty of its own, which makes it show off among other plants. It is a great pity that *Araucaria excelsa* is so easily injured; if it would only bear plenty of knocking about, it would be a grand thing for decorating.

Mr. Clarke was growing a nice batch of *Ardisia crenulata* from seed; this is found very salable as a pot plant at Christmas and around that season. Even a small plant is showy when well berried.

Pandanus Veitchii, as seen here, recalls the fact that this is decidedly more valuable than *utilis* for general use; it is more showy, and stands better. *Pandanus utilis* has a trick of burning or getting rusty just when needed at its best; of course, it has its uses, but the other variety is more serviceable to the general decorator.

Among ferns, while *Adiantum cuneatum* must be considered a leading sort, *A. decurum* is much liked commercially; it is exceedingly handsome in a medium-sized plant. *A. gracillimum* is charming when just right, but it is so apt to turn rusty and distressed looking just as soon as it is well grown, that it is of little use commercially. For decorators and retailers the harder ferns must be grown.

For trade purposes, *Primula obconica* has been found best when two or more plants are potted in a clump, so as to make a larger mass. The greater quantity of flowers and foliage takes off the weedy look so often complained of in this plant.

EMILY LOUISE TAPLIN.

Tuberous Begonias.

As supplemental to what we have already said regarding these begonias we have pleasure in presenting in this issue excellent engravings of two groups of flowers, one showing typical single and the other typical double forms. The illustrations show the blooms two-thirds natural size. The colors are shades of white, red and yellow.

Hardy Plants.

MAY FLOWERS.

Many of the plants mentioned last month will continue in bloom into this month. Among these are *Arabis alba*, *doronicums*, *epimediums*, *lungwort*, *diantra*, *anemones*, *candytuft* and *primroses*. And several species of *narcissus*, for instance *poeticus*, and *jonquils* and Dutch *hyacinths* and *gay tulips* will enliven the garden for some time to come.

TRITELEIA UNIFLORA is a little bulbous plant from Buenos Ayres with bluish white star flowers. It is quite hardy here, blooms gayly in April and May, multiplies considerably and is an exceedingly pretty little plant to look at, but when bruised it smells like garlic. It is a good deal grown for greenhouse decoration, but it is never so pretty as when in clumps or belts out of doors.

PHLOX SUBULATA, the moss pink re-

ferred to last month, is now in its fullest glory, a solid sod of bloom. If you shear off the flowers when they begin to fade the leaves beneath them will not rot off as they sometimes are apt to do, but this clipping is not imperative. *Phlox setacea* is just the same thing. Last winter I lifted a few sods of it and potted off the little rooted pieces into 2½-inch pots which were then put out in a cold frame. They are nice rooted plants now, and many have been planted out and every one has grown well. Besides the *P. amena* and *P. reptans* also now in bloom, *P. Stellaria* will soon be a solid cushion of lavender blue flowers. It is very easily raised from cuttings.

TIARELLA CORDIFOLIA or False Miterwort as we commonly call it, is a little wild plant that spreads considerably in leaf mold beds in rocky woods, and in May bears a great profusion of upright racemes of fleecy white flowers. Easily cultivated and well worth growing in faintly shaded places.

POLEMONIUM REPTANS or creeping Jacob's ladder, is another little native plant well worth growing in a slightly shaded place. The flowers are bluish, profuse, but not showy. Other taller and later blooming species are *P. ceruleum* and *confertum*. They may be raised from seed or division.

DODECATHEON, or Shooting Star, comes into bloom about the third week in May and when grown in generous bunches is a very attractive plant. It hardly pays to raise it from seed, better get good plants to begin with, they grow abundantly wild in some parts of the country.

IRISES.—The forms of *I. pumila* enter May well represented, and are soon accompanied by the dwarf *I. cristata*, and larger growers as *I. Florentina*, *tenax*, *Bohemica*, *obliensis*, and a host of the German *irises* which, in many cases, are quite pretty. The *I. Sibirica* will also prevail wherever it gets a footing.

ARNEBIA ECHINOIDEA, the prophet flower, from Northern Persia, is one of the choicest and most interesting of garden plants. It belongs to the borage family, comes into bloom about the middle of May, and has primrose yellow flowers with five black crimson spots on their face, and these spots which are so vivid when the flowers open gradually disappear till in a few days no trace of them is left. Although this plant has been in cultivation for a good many years it is still high priced and scarce in cultivation, and seldom included in price lists in this country.

TROLLIUS or globe flower.—These are globe-flowered yellow ranunculuses or buttercups, not uncommon in old gardens, and quite pretty, and given moist, good soil and protection from wind and bright sunshine, they grow strongly and bloom beautifully in May. *Trollius Europeanus* has globular lemon yellow flowers; *T. Asiaticus*, from Siberia, has large golden yellow, rather flat blossoms. *T. napellifolius* from the Carpathian Mountains has deep yellow globose flowers, and is one of the finest of all, and *T. sinensis*, from China and Japan, has deep yellow half open flowers that come into bloom later than the others. *Trollius laxus* is our native globe flower. It blooms earlier than the others, but is barely as showy. Although they are propagated by seed or division of the root, their increase in quantity is somewhat slow.

AJUGA (Bugle flower).—While the different kinds of *ajuga* can not be regarded

GROUP OF TUBEROUS BEGONIAS; SINGLE FLOWERED FORMS. TWO-THIRDS NATURAL SIZE.

as showy flowering plants, they come into bloom in May and last into June, and are capital plants to let run wild in rockwork, also for edgings in gardens. I use *A. reptans* largely for edgings, and lift, divide and reset it every year. There

are crimson-purple and variegated leaved forms of it. *A. alpina* is a very dwarf pretty species, of which there are blue and white flowered varieties. And *A. genevensis* is the finest of all; it is really a fine blue flowering border plant.

SOLOMAN'S SEAL (*Polygonatum*).—The common one, *P. multiflorum*, is worth growing, especially in lightly shaded places, and another good kind is the Japanese *macranthum* which has unusually large flowers. They will also

grow well in the open border. And they are good plants for forcing, but whether or not as forced plants they would be attractive enough for the florists' customers, to pay, can only be known by trial.

COLUMBINES.—May and June are the season of columbines, but *Aquilegia truncata*, red, and *A. chrysantha*, yellow, extend the season a month or two longer. We have lots of double flowering and hybrid forms, but in my estimation all are inferior to the true species. Among the best to get are *Aquilegia Siberica*, the earliest; *A. formosa*, red; *A. carneia*, blue and white, long spurred; *A. Olympica*, blue and white, short spurred, and *A. chrysantha*, yellow and the latest of all. And get some seed of *A. glandulosa*, it is blue and white, short spurred and a little gem but short lived, that is, it is well to keep up a fresh lot of plants every year from seed. The John Grigor nurseries, Forres, Scotland, have made a specialty of this columbine for over 30 years, and in order to keep it pure they grow no other kind. It used to be known there about as Brodie columbine, but why I never could find out. And I have failed to discover any difference between this of the reputed distinct forms of this species as raised from seed obtained elsewhere, and the plants I raised from seed got from Grigor. All of the plants of *Aquilegia longissima*, that most wonderful of all long-spurred columbines, that I raised from seed some ten years ago are now dead, and the species in the meantime so far as I can learn is lost to cultivation. Surely some one collecting in Northern Mexico will again introduce it.

DOUBLE FLOWERING ROCKETS (*Hesperis matronalis*).—We have the double white and the double purple, and both are as desirable, in their way, as are good stocks. They like good moist ground. And we should raise a fresh stock of plants from cuttings every year because the old plants are not very persistent.

DOUBLE FLOWERING CUCKOO FLLOWER (*Cardamine pratensis* fl. pl.).—The common cuckoo flower or lady's smock is a very common flower in moist or wet meadows in Europe, and the double-flowering variety, which is really a good thing, is just as easy to grow as is the single one, but it must have moist ground.

LILY OF THE VALLEY.—Every florist should grow quantities of this out of doors. It is in full bloom with us about the 20th of May. To have it in its finest condition grow it in the open ground in good moist land and mulch it with rotted manure in fall, letting the manure stay there permanently and add to it every year. The idea that lily of the valley should be grown in a shady place is erroneous, if you are looking for good flowers and lots of them. And when they get too thick in the patch dig up strips of them for forcing.

CYPRIPEDIUMS.—About the 20th of May *C. pubescens* comes into bloom and is immediately followed by *C. parviflorum* and then by *arictinum* and *candidum*, two interesting but not showy species; *C. acule* first opens about the middle of May and *C. spectabile* not till the end of the month or first of June. *Pubescens*, *parviflorum* and *spectabile* are worth growing and easily cultivated, they grow and bloom well year after year and under favorable circumstances increase in size, and the flowers are good for cutting. *Acule*, except as a frame or pot plant, seldom acts well in captivity. I have found them all to thrive in faintly shaded, good, moist ground, mulched with sphagnum moss and leaf mold mixed

together so as to preserve an open surface. Warm sunshine upon their blossoms will injure them.

HEMEROCALLIS, or DAY LILY.—The first to bloom is *H. dumortieri*, a species of neat, bunch, compact habit and bearing bronzy orange yellow flowers in May and early June. An excellent plant for forcing, also for outdoor Decoration Day flowers. But the flowers do not rise high above the foliage as do those of *flava* and *Thunbergii*. About the end of May or early in June *H. flava*, clear yellow, comes into bloom, it is a vigorous growing, copious and most desirable plant. *H. minor* (graminea) blooms immediately after *flava*, and although it is a smaller plant in all its parts and less showy, its flowers, which are also yellow, are well liked for cutting.

PEONIAS.—About the 20th of May *P. tenuifolia* comes into bloom. Single or double flowered it is a gem, but it is very scarce and slow to grow to large size. It never becomes large masses as do the Chinese peonias, and one has to wait several years before he can get a good specimen out of the little morsel one generally gets when he buys a plant. The tree peonias come into bloom about the same time, so too do the old double red herbaceous peonia, and soon after it the handsome white *albiflora*. Then till well into June we have the gorgeous multitude of herbaceous peonias. And all are hardy, easily grown and long lasting.

ARMERIA (THRIFT, or SEA PINK).—I grow the common *A. vulgaris* for edgings and the *A. cephalotes* as a garden plant. Numerous names are given to the different forms. The *vulgaris* makes an extremely neat edging, it never spreads beyond bounds, and if nothing over-spreads it in summer it lives untarnished, and it blooms in May and into June. I lift, spread or tear it apart and replant it every year. The *cephalotes* is barely hardy, so it is well to winter it in a frame or have it on raised soil where no water can lodge about it. But it is a large flowering fine species. It should be increased from seed, as there is danger in breaking the clumps.

We have the Clivedon white and Clivedon yellow bedding pansies in bloom and they are very decided and pure in color and compact in growth. Grape hyacinths abound in the grassy places or borders where they have become naturalized; the European blue bells (*Scilla campanulata*) are at home under the same circumstances; and the blue quamaish (*cassasia*) is in good bloom. *Cheiranthus alpinus* is a cushion of yellow and *Erysimum rupestre* a mat of the same color. Rue anemones and wood anemones, single and double, and crown and fulgens anemones are still in fine condition. The dwarf ginseng (*Aralia trifolia*), dwarf cornel, star flowers, fringed polygala and the spreading blue (*Houstonia serpyllifolia*) are enjoying themselves in sharply shaded places. *Saponaria ocy-moides* spreads into a broad carpet of pink, and the double ragged-robin is decorating many a door yard. *Valeriana aliarifolia* is a bold plant thriving in open border or lightly shaded place and producing large heads of white flowers. *Thermopsis fabacea* displays its yellow pea flowers towards the end of the month when the beautiful feverfews, single and double, also come in.

Glen Cove, N. Y. WM. FALCONER.

Buying New Varieties.

Personal controversy between any of the correspondents of the FLORIST can be of little moment to the readers of the

paper, and is certainly of no value to its editor. Therefore, any further reference to the conflict of opinion between Mr. Dallas and the writer would be unnecessary, but that in his remarks contained in the FLORIST of April 1, there is a point of issue which should be of consequence to all who are concerned in the success of a florist's business.

It has ever been the purpose of the writer in all communications written for the FLORIST to bear in mind one fact—that it is a paper managed with the express object of helping florists as business men; and to teach the lesson that in all our operations we should be guided by business principles; gauging these operations not from the standard of personal inclination, but from that of dollars and cents. The question—"Does it pay?"—is the question that the FLORIST ever reiterates in our ears. A question that every enterprising man should always ask himself in all that he undertakes to do in the way of business transactions.

It is perfectly legitimate for any man to take exception to ideas or suggestions that are published when they do not appear to him to be in accord with the truth; but when he does so he should be careful as to his own facts before he makes his attack and be sure he is arguing from correct premises.

It was never stated by the writer that he paid \$2 for a plant of Mrs. Andrew Carnegie, and then failed to grow it. He never made any public statement as to the merits of this chrysanthemum. Strange that the thought underlying the words should be so mistaken. The argument was as follows: That no man paid \$2 per plant for this variety and made money by the transaction. That the "disseminator" made money by the sale of the plant we all acknowledge. No one ever said he did not. If a man could not do so at such a price for chrysanthemum plants he should at once yield all claim to the title of a business man.

I again repeat the statement. That no man ever paid \$2 for a chrysanthemum plant and made money by the sale of the flowers. If this statement is untrue it can easily be proven untrue. Mr. Dallas will have us infer that this has been done; if so, he must have facts in his possession which, if published, would quite refute me. Just such facts the FLORIST undoubtedly desires as contributions.

But Mr. Dallas kindly sums up my own argument for me. I have contended for no more than he grants. That the indiscriminate buying of new plants is disadvantageous to the florist who wishes to do a paying business. But the test as to the plants florists buy should be the commercial one. It is of little importance to us as florists, what merits a plant may have if we can not make it pay. The gentleman maintains that I publicly denounced the chrysanthemum in question, and that it is unfair to cry down any particular plant because we are not in a position to make money by it. All of which statement, so far as it refers to me, has no fact for its foundation. The only standard for me as a florist is the florist's standard, and only by that standard is a personal judgment passed upon varieties that meet with personal observation.

The general tendency is to sift in every class until only a few kinds are left that are considered of value to the florist as a business man. Of the numberless roses catalogued and disseminated only a few are fit for forcing. Of the numberless chrysanthemums the same rule holds good. And with florists' flowers the essential feature with most of them is

GROUP OF TUBEROUS BEGONIAS; DOUBLE FLOWERED FORMS. TWO-THIRDS NATURAL SIZE.

their capability of being forced, and this must be the standard by which commercial florists will judge a new plant when it is sent out, the rank it is likely to take as a money producer.

Mr. Dallas has been pleased to make some gratuitous assumptions concerning my enterprise and methods of conducting my business. These assumptions are of no consequence to any one but himself.

It is respectfully suggested that as he has never had an opportunity of examining these business methods it is entirely beyond his province to pass judgment upon them.

ALFRED E. WHITTLE.*

Detroit Spring Exhibition.

Fourteen thousand paid admissions on the first day, twenty-one thousand on the second day, and a total attendance of fifty-one thousand people during four days was the most striking feature of the Detroit spring exhibition. And what drew this immense concourse of people? Not flowers and plants alone, but plants, flowers, music, and last, but not least, temples, kiosks, cottages and similar structures representing the architecture of various peoples, both ancient and modern, occupied by pretty girls arrayed in the costumes of various countries and to represent mythological characters. Flowers, music and fair woman's smiles made up a combination that drew the people as no flower show alone could have done, while the fact that the net proceeds were to be donated to the city charities undoubtedly had its due effect.

The floral part of the exhibition was excellent, a decided advance upon that of last year at the same place, the plants especially showing evidence of more care in growing. It is apparent that the two previous exhibitions have spurred the Detroit florists on to greater effort, and that the effort has been followed by results.

In addition to the exhibits by the local florists, there were several displays by florists from other cities, prominent among which was the collection of orchids shown by Pitcher & Manda, Short Hills, N. J. Their display of cut blooms was superb, and would have done credit to them at any exhibition. Including plants as well as cut flowers, there were some 200 varieties among which were to be noted a rare *spatoglottis*, the white *Cattleya trianae*, a splendid form of *Laelia purpurata* with deep-colored lip, *Dendrobium macrophyllum*, *D. chrysotoxa* and other choice kinds. The collections of cypripediums, cattleyas, epidendrums, odontoglossums and oncidiums comprised nearly everything available at the season. A row of small plants of *Grevillea robusta* made an admirable background for the display of cut orchids.

Densy Zingiebel Needham, Mass., had sent a box of blooms of his famous pansies, and they were, as usual, the subject of many admiring comments. Isaac C. Rogers, Morristown, N. J., sent some specimen cosmos blooms.

Six handsome specimen ivy-leaved geraniums, shown by Andrew Ferguson, were considered worthy of special mention by the judges, no premium having been offered in the regular list.

The mantel and table decorations were nearly all good and some were of decided excellence. For best mantel decoration the Detroit Floral Co. received first for a most beautiful arrangement, mainly of ferns and other greenery; D. C. Jones took second for an arrangement similar in style; J. Breitmeyer & Sons third, and J. F. Sullivan fourth. J. Breitmeyer & Sons were first on table decorations with a center piece of hybrid roses rising from a bed of greenery, edged with *Primula obconica*, over which a colored globe shed a light which gave a peculiarly rich effect. D. C. Jones was second and Detroit Floral Co. third. Floral baby gift, J. Breitmeyer & Sons first; Bachelor's supper design, D. C. Jones first, with an accurately worked out figure of a stag's head resting on a base of loose flowers and foliage. Basket of flowers, J. Breitmeyer & Sons, first, J. F. Sullivan, second; Bridal bouquet, Detroit Floral Co. first, J. Breitmeyer & Sons second; Design of any kind except funeral, first, B. Schro-

ter, second, J. F. Sullivan; Easter design, B. Schroeter first, J. F. Sullivan second; Floral butterfly, J. Breitmeyer & Sons second; Wedding gift, J. Breitmeyer & Sons first.

In plants: First premiums were awarded to John Breitmeyer & Sons for 6 azaleas, 12 Rex begonias, 12 callas, 12 red carnations, 20 white carnations, display of ferns and lycopods, 12 heliotropes, 10 *Lilium candidum*, 4 hybrid roses, collection of hybrid roses, 3 rhododendrons, specimen *Marguerite*, specimen palm, group of decorative plants, 12 palms in 8 to 10-inch pots, 6 palms in 6 to 8-inch pots, pair palms, collection of palms; Second premiums for 12 azaleas in 6 to 8-inch pots, 12 blooming begonias, 12 *Pteris tremula*, 6 *Pteris tremula*, 12 adiantums, 6 pink hydrangeas, 3 pink hydrangeas, 6 white hydrangeas, 3 white hydrangeas, display of orchids in bloom, 10 hybrid roses, 10 spirea, 6 spirea, 20 Dutch hyacinths, 50 narcissus and jonquils, 100 tulips, specimen fern, specimen hydrangea.

Andrew Ferguson, First premiums for 12 azaleas in 6 to 8-inch pots, 6 pink hydrangeas, 3 pink hydrangeas, 10 hybrid roses in 6 to 8-inch pots; Second premiums for 12 heliotropes, collection of hybrid roses, and a special for 12 calceolarias.

Gus H. Taepke, First premiums for 12 cinerarias, 12 fuchsias, 6 fuchsias, 3 white hydrangeas, 12 ever-blooming roses, 6 ever-blooming roses; Second premiums for 6 azaleas in 6 to 8-inch pots, 12 Rex begonias, 12 red carnations, 6 named geraniums in 6 to 10-inch pots, 25 named geraniums in 6 to 10-inch pots, specimen *Luchsia*, specimen geranium.

A. Breitmeyer & Son, First premiums for 12 blooming begonias, specimen fuchsia, display fancy foliaged geraniums, 6 12-inch hanging baskets; Second premiums for 12 callas, 12 fuchsias, specimen spirea, single hanging basket, pair hanging baskets.

Detroit Floral Co., First premiums for 12 *Pteris tremula*, 6 *Pteris tremula*, specimen adiantum, 12 adiantums, 6 adiantums, pair adiantums, specimen fern, specimen hydrangea, pair 12-inch hanging baskets, best arranged lawn vase, pair lawn vases; Second premiums for display of ferns and lycopodiums, 10 *Lilium Harrisii*, 40 Dutch hyacinths, specimen *Marguerite*, 12 palms in 8 to 10-inch pots, 6 palms, pair palms, collection of palms, 6 12-inch hanging baskets, 12 named geraniums in 6 to 10-inch pots.

Holzagle & Noel, First premiums for 12 named geraniums in 6 to 10-inch pots, 6 named geraniums in 6 to 10-inch pots, 25 named geraniums in 6 to 10-inch pots, specimen geranium, 12 coleus; Second premium for display fancy foliage geraniums.

J. F. Sullivan, First premiums for 10 *Lilium Harrisii*, 10 spirea, 6 spirea, 20 Dutch hyacinths, 100 narcissus and jonquils, specimen spirea; Second premiums for 2 blooming camellias, 5 *Lilium Harrisii* specimen camellia.

B. Schroeter, First premiums for 25 cinerarias, 6 pink hydrangeas in 8-inch pots, 40 Dutch hyacinths, 50 narcissus and jonquils, 100 tulips, carpet bedding arrangement; Second premium for group of decorative plants.

F. W. Lemke, First premium for 6 white hydrangeas and special for 12 double petunias.

Chas. Warneke, First premium for 18-inch hanging basket; Second premiums for lawn vase and pair lawn vases.

Pitcher & Manda, Short Hills, N. J., First for general display of orchids in bloom.

In cut flowers J. Breitmeyer & Sons received first premiums for 6 spikes *Lilium candidum*, 50 white carnations, 12 spikes Dutch hyacinths, 50 blooms mignonette, 100 blooms pansies, general collection of roses, 12 American Beauty, 12 Bennett, 12 Bon Silene, 12 Jacq, 12 hybrid perpetuals, 12 La France, 12 Mme. Cusin, 12 M. Niel, 12 Papa Gontier, 12 Safrano, 12 Souvenir de Wootton, 50 tulips, 25 tulips, 6 *Primula obconica*. Second premiums for 50 red carnations, general display of carnations, 12 sprays *Lilium Harrisii*, 50 sprays lily of the valley, general display cut orchids, 12 Bride roses, 12 Mermet, 12 Niphotos, 12 Perle des Jardins, 12 Sunset.

J. F. Sullivan First premiums for 12 callas and 12 sprays *Lilium Harrisii*; Second premiums for 8 camellias, 12 Dutch hyacinths, 12 rose Safrano.

Holzagle & Noel First premiums for 50 red carnations, general display of carnations; Second premium for general collection of roses.

Detroit Floral Co., First premiums for 50 sprays lily of the valley; Second premiums for 100 pansies, 12 American Beauty roses, 6 American Beauty, 12 Souvenir de Wootton.

A. Breitmeyer & Son, First premiums for 12 Bride roses, 12 Mermet, 12 Niphotos, 12 Perle, 12 Sunset; Second premiums for 12 Bon Silene, 12 Papa Gontier.

Pitcher & Manda, First premium for general display of cut orchids.

B. Schroeter, Second premium for 50 blooms mignonette.

Pitcher & Manda carried off a large number of special prizes offered for orchids. J. Breitmeyer & Sons taking the seconds in same classes.

Messrs. E. G. Hill, Richmond, Ind., W. J. Stewart, Boston, and G. L. Grant, Chicago, acted as judges.

Boston.

The customary revival in the cut flower trade directly after Easter has not been experienced this year. It is reasonable to expect an increase in the demand for flowers to correspond with the resumption of fashionable entertainments, weddings and other society events which are supposed to follow the close of Lent, but the reverse seems to be true this year, and the florists have had to undergo an unwelcome two weeks of stagnation. The overstock of roses in general has knocked prices on most varieties all to pieces, and as for lilies, the belated *Harrisii* and *candidum* blooms that have come to the market might as well have been "dumped" behind the greenhouse, for they are not wanted at any price. Very large quantities of flowers, roses, pansies and violets especially, have been disposed of by the street fakirs at popular prices, and these busy individuals seem to get more and more abundant each season. It is hinted that some of the large florists who are loudest in their denunciations of these gentry are not averse to making use of their methods themselves in a quiet way, and that a number of these corner traders are sent out on the sly, not only by some of the largest stores to help unload their surplus, but are in many cases made use of by the big growers for the same purpose.

The annual supper of the Gardeners' and Florists' Club was celebrated according to the most approved style, on the evening of April 10. It took place at the United States Hotel. The number who sat down to the tables was ninety. The number who got up from the tables was variously estimated at from 180 to 360. The ninety were the net result of the very

1—Palms 2—Mabel Morrison roses. 3—Jacqs. 4—Am Beauties. 5—Maidenhair Ferns.
7—Baskets of Roses. 8—Lycopodium.

earnest work of the efficient committee entrusted with the general arrangements. The 180, more or less, were the result of the combined efforts of Mr. Wax and Mr. Hatch, ably seconded by the Cefrey Immortelle Letter Company. Mr. Cefrey's new machine-made letter is equalled only by the splendid punch in whose agreeable company it made its introductory bow to the Boston florists on that evening. A goodly representation from the New York Florist Club was expected, and chairs were tipped up in anticipation of their arrival, but the only visitor was the always welcome Mr. Manda from New Jersey, who remains ever loyal to his old Boston friends.

The success of the Massachusetts Horticultural Society's application for permission to erect a large exhibition tent on Boston Common next August is exceedingly gratifying, and the delegates to the National Convention are now assured of a great horticultural treat. It will be an exhibition worthy of a long journey to see.

The usual spring show of flowering bulbs on the Public Garden is now in full glory, and attracts crowds of visitors.

W. J. S.

Washington.

The recent dinner given by the delegates of the Pan-American Conference to the President of the United States offered another occasion, and probably the greatest of the season, to the florist to display his skill.

The table was of unique form, representing an eight-pointed star. The center consisted of an almost circular oval, 14x18 feet, from which radiated eight tables four feet wide and from twelve to twenty-two feet in length. Along the middle of each one of these tables ran a belt about twenty inches wide, of maidenhair ferns, alternating every two feet with low baskets of choicest roses, each basket having a distinct variety, either of Luizet, Laing, Rothschild, La France, Brunner, Albany or Bennett, producing a most beautiful undulating or billowy effect of rose and fern as far as the eye could reach. At the junction of each table with the centerpiece stood an elegant silver candelabra, with the light of

the candles softened by shades of white and silver.

But the art of the florist culminated in the decoration of the oval centerpiece, producing a creation of beauty which fascinated the eye. In the center of a colossal star, fourteen feet in diameter, stood a superb palm (*Phoenix vestis*), from whose gracefully spreading branches and broad leaves hung light and dainty garlands of asparagus giving the palm a moss-covered effect, strangely tropical in its character. Through this net-like covering of the tall palm gleamed a myriad of tiny electric lights in red, white and blue shades. The center of the star directly underneath this palm was a mound of several hundred pure white Mabel Morrison roses, while the points were composed of 500 Jacqueminots, imparting to the center of the table a richness of color and a vividness of contrast that is seldom attained in such extensive decoration. The inverted triangle between each point of the star was a miniature garden of maidenhair ferns with a cluster of American Beauties in each center, a wide fringe or border of lycopodium extending entirely around the great oval centerpiece. This ocean of color and fragrance which formed the centerpiece spread, as already stated, in alternating billows of maidenhair ferns and roses to the extremity of each table. No less than two thousand roses were used for this purpose alone; the 120 boutonnières were made up of a Jacq bud and lilies of the valley.

But the florist did not stop here. Each corner and window recess of the great dining hall presented stately groups of palms, ferns, lilies, azaleas and hydrangeas. Upon the wall between the windows were artistically designed rosettes of palm leaves, six feet in diameter. The orchestra balcony, in addition to other decorations, was rendered attractive by three entwined wreaths of laurel, each bearing, in immortelles, the appropriate word "America." This entwining of the three Americas was emphasized by a huge lover's knot of red, white and blue broad-banded ribbons. This idea, so full of sentiment and good will, originated with Senor Romero, the Mexican minister, and was pronounced one of the happiest inspirations of the event. The

floral display, which was the work of Small, the florist, was enthusiastically praised as being the most original, elaborate and artistic ever seen in Washington—where lavish floral decorations at great entertainments are becoming more and more frequent. Z.

New York.

The flower trade for the two weeks following Easter was good, though it began to slack down after that. Prices remained unchanged, for the most part more bulbs came in after Easter; tulips, which were scarce at that time, became comparatively plentiful, but it is evident that not nearly so many bulbs were forced this past winter as formerly. If the usual amount of tulips, etc., had been in it is not likely that roses would have sold so well. A good many hydrangeas and lilies came in after Easter, but they were useful for the large decorations. After Easter narcissus began to come in heavily; they will continue to do so for some little time.

The comparative scarcity of carnations was felt a good deal; it is doubtful whether there has ever been such a general failure before.

Violets have been very good generally, but the finest have been grown in frames, entirely without heat. This would seem to be the most natural way of growing violets, though it is doubtful whether it could be done during some of our very severe winters. They are best grown in frames facing the southeast, with some sort of wind-break at the north, and are kept from freezing by a thick covering of salt hay, which is only removed on bright days. Violets grown this way, without any heat, never seem to be troubled with disease, and the flowers are very fine.

White stocks are to be seen in some florists' windows, nicely grown too. They do not make a showy flower, but make a change at this season.

The second week after Easter was remarkable for its bright weather—a week of sunshine has become a novelty in New York, consequently it brought flowers out with a rush. On the 19th a lot of roses were sold for \$1.50 a 100, this can not be taken as a standard price, but a good many were sold for it. A great many hybrids were in and prices began to decline with them. The street peddlers were out in full force with roses, as well as swamp buttercups and arbutus. These spring wild flowers are seen in the stores as well as on the street, as there is always a certain amount of call for them, though no really great demand.

Rudolph Asmus is going to enlarge his place this year by rebuilding some of his present houses and erecting new ones.

H. A. Siebrecht is enlarging his residence at New Rochelle, and his partner, Mr. Wadley, is building a handsome house at the same place. This firm is now building a lily pond in the angle of their greenhouses, where they expect to flower the Victoria regia this year.

Thos. Young, Jr., is now in treaty for Joseph Jefferson's old homestead at Holokus, N. J., and expects to get it, though the purchase is not entirely consummated. It is a very fine old place, though the famous actor has not lived there for some years.

Plant auctions are exceedingly numerous this spring. Robert Young intends having two auction rooms to give a better opportunity for disposing of his business.

The New York Florists' Club has sent out a circular calling for subscriptions to a permanent fund for the purpose of

holding semi-annual exhibitions of everything appertaining to horticulture. The subscriptions are to be received in sums not exceeding five dollars. At the meeting of the club on April 14 this subject was discussed; the members are desirous of holding a good exhibition and will bend their united energies in that direction. At the next meeting of the club the subject under discussion will be the proposed changes in tariff as affecting the plant trade and it will be of especial interest in the business. It is rather hard to get at any real understanding of this subject—opinions are very conflicting, but the ground taken by Peter Henderson & Co. is agreed to by a large proportion in the trade.

Ernest Asmus has been building a fine residence, which looks like a modernized castle with its handsome turrets.

Mr. Alfred Henderson is slightly improving in health, though unable to take any active part in business. He is still staying in Virginia.

Nomenclature.

S. A. F. Committee on Nomenclature.

JAMES D. RAYNOLDS, Riverside, Ill., Chairman.

Roses:

ROBERT CRAIG, 49th & Market Sts., Phila., Pa.
EDWIN LONSDALE, Chestnut Hill, Phila., Pa.

Mrs. Alpheus Hardy.

THE "OSTRICH PLUME" CHRYSANTHEMUM.

ED. AM. FLORIST.—I was surprised at Mr. John May's criticism of our advertisement of the chrysanthemum "Mrs. Alpheus Hardy" in your issue of April 1. I say ours, because no other house in this country but that of Peter Henderson & Co., have used the expression "The Ostrich Plume" in connection with the name of the variety. I hope I am broad enough to frankly recognize another's right to make any fair or truthful criticism, but that Mr. May's strictures are not only misleading, unfair, but also ungenerous, I believe any fair minded man will quickly decide.

To begin with, Mr. May charges that we have "renamed" the variety. I challenge him to produce any advertisement of this chrysanthemum sent out by us, or any catalogue or price list of ours where the true name, "Mrs. Alpheus Hardy," does not appear. The term "Ostrich Plume" as we use it is no more a synonym than the heading that also appears in the same advertisement, "A Glorious Flower," and no plant of it has ever been sent out by us that bore any other label than "Mrs. Alpheus Hardy." To prove our consistency, let Mr. May turn to the second page of cover of our catalogue for 1890, of "Everything for the Garden," and he will find that at the bottom of the page we offer plants, deliverable Jan.

1, 1891, of the Pink Ostrich Plume chrysanthemum "Louis Boehler." Surely we are not foolish enough to designate two varieties of the same plant by the same name. Mr. May's article shows that he has a good deal of both business and advertising experience yet to learn, for I know beyond all question that the designation to which he takes exception has increased the sales of this chrysanthemum with florists who were wide awake enough to secure a stock, at least ten-fold more than if we had not used it.

Mr. May also says that the term "Ostrich Plume is no more applicable to this particular flower than is a cabbage to a clam." Passing by his poetical comparison, let me say, that when we first saw this variety (fall of 1888, I think), its resemblance to an ostrich plume was one of the first things that struck us, and although we never used the expression until we had the plants to offer, the resemblance must have also occurred to other minds, for last summer in the *Gardeners' Magazine*, of London, the introducer's European agent in describing its wonderful beauty says that "in appearance it suggests an ostrich plume."

Another quotation from Mr. May and I am done. He says: "Is it not much more just, fair and honest to call a plant by its right name?" In fancy I see the lofty poise of our friend, as he gives forth this oracular utterance, and it is well for us all to feel that at Summit we have still a sage, whose code of earthly virtues is so nearly perfect that on him we can always safely lean. Yet it is to be regretted that Mr. May should have made such an uncalled for attack. Wise man that he is, we hope he may some day conclude that, in this instance at least, he would have done better to have remained silent, or to bring the matter more clearly to his comprehension, closed up as tight as his favorite "clam."

ALFRED HENDERSON,
of Peter Henderson & Co.
New York, April 17, 1890.

Californian Plant Novelties.

In the interesting notes on novelties in the AM. FLORIST April 1, I observe that the botany of California is quoted in the reference to the "Pride of California," *Lathyrus splendens*, Kellogg. When Prof. Sereo Watson's great work was published, *Lathyrus splendens* was virtually unknown. Not until the spring of 1882 was this magnificent vine rediscovered, by the late Dr. C. C. Parry and C. G. Pringle, with whom I had the honor of traveling at the time. From that time to the present there has been no question as to this wild pea being entirely distinct from any other species. Unfortunately the writer distributed seed of *Lathyrus venustus* with seed of the true *splendens* to European correspondents in the fall of 1882, hence the present confusion that exists. The true *splendens* has dark, brilliant rose red flowers, large and full, borne in dense clusters. Once seen it can scarcely be forgotten, and in our mountains where this lovely vine trails over the native shrubbery, it has gained the appropriate name of "Pride of California." It is a hardy perennial and a profuse bloomer. I found it in bloom this season on New Years day in our mountains. I took great pains to secure seed of the genuine *splendens* last season and was successful in my effort. A variegated variety of this I have also observed.

Lathyrus venustus bears smaller flowers of a purple rather than rose red color,

but seems to have met with favor in its accidental introduction into Europe under a false color. We find *Lathyrus venustus* described in Wm. Bull's catalogue (London) under the name of *Lathyrus splendens* as follows: "A splendid perennial climber, producing a profusion of large scarlet-purple blossoms in clusters of from 10 to 12. The individual flowers are 1½ to 2 inches in size, with large banner-like petals. The plant is allied to the common everlasting pea, but the blossoms are larger and more abundant and their color is brighter." *Lathyrus vestitus*, to which *L. splendens* was erroneously referred by Prof. Watson, in the Botany of California, is an equally lovely perennial pea, with white blossoms delicately striped with rose-red veins. It is entirely distinct from either of the preceding species (each higher than mere varietal rank).

Dodecatheon Clevelandi has gained prominence in catalogues and is deserving of all the praise it receives. This lovely plant, which has in some catalogues been called the "giant cyclamen," from its resemblance to the Mad Violet of Italy, is really no more than a variety in my judgment. It is, however, destined I believe to a permanent place in our affections, and as many forms will perhaps be brought to the attention of florists as there already exists of its near relative, *Primula obconica*. I have this season detected a tendency in the flowers to grow double—the stamens becoming abnormal petals, while the usually five divisions of the reflexed corolla has multiplied to ten and twelve divisions. *Dodecatheon Clevelandi alba*, with white flowers, and *D. Clevelandi elegans*, with phlox-purple flowers, are two varieties which will be offered for the first time during the following season. The center of all these varieties is a rich purple, bordered with bright lemon yellow. The base of the exerted stamens are also of a rich purple purple, tipped with primrose yellow. The corolla varies in color as above noted, from pure white to phlox purple.

Single flowers of *Romneya Coulteri* grown in this city have measured nine inches across. It is a magnificent plant and with us attains a height of fifteen feet or more as a rule. It is attracting attention at home as well as abroad, and any information as to its treatment in cultivation is eagerly sought after in Southern California. Your illustration of this is the best I have yet seen, but scarcely gives an idea of its appearance in its native canyons. C. R. ORCUTT.
San Diego, Cal.

Clematis "Paniculata."

The plant that was grown in the Botanic Garden, Harvard University under this name and included in its catalogue of plants in 1879, is not the same plant as the one your correspondent, page 432, has reference to at all, and I am satisfied the Harvard plant was the true one. And turning up the matter in my old books I find that the Harvard plant was examined and labeled by Prof. C. S. Sargent, one of the most careful and accomplished botanists living, and with the most complete botanical library and herbarium in the country at his command.

Until I read your correspondent's note I had never known or heard of his being "in a measure responsible" for anything in connection with the plant in question. Yes, our plants have been raised from seed, and the plants are here now healthy and vigorous to bear witness for them-

selves, and I shall be delighted to show them to any one who cares to look at them. Because your correspondent has failed to grow it from seed is no reason whatever why others should not succeed. We all know every species of clematis in cultivation can be grown from seed, only it often takes several months or a year for the seed to germinate.

WM. FALCONER.

Is Primula Obconica Poisonous?

In a recent issue of *Garden and Forest*, Dr. George Thurber contributes an interesting article under the heading "A so-called poisonous primrose" from which we extract the following:

"It is certainly singular that so many should have suspected *Primula obconica* as the cause of annoying skin troubles in themselves and others, without closely examining the plant. A pocket magnifier of moderate power would have revealed such a condition of hairiness that would have suggested further examination with a compound microscope. Both surfaces of the leaves, and especially their margins, show a great abundance and variety of hairs, while the petioles or leaf-stalks are conspicuously hairy, as may be seen without the aid of a glass. To one interested in Trichomes, this plant presents material for study in great abundance and variety. At my request, Mr. John Payne has

would also give them firmness to penetrate the skin when the plant was handled, and, breaking off, they would remain and cause irritation. Has any one examined the skin of an affected person with a magnifier to see if the hairs were remaining in the skin? I did not meet with the only person among my friends whom I know to be affected by the primula until long after the irritation had ceased. Some have likened the effect produced by *Primula obconica* to those of *Rhus Toxicodendron*, the poison ivy, but it is a well established fact that many persons are poisoned by *rhus* without coming in contact with the plant. Merely passing near it or being near a fire where it is being burned is sufficient to cause serious poisoning, indicating that the active principle is volatile. In stinging with nettles an acid liquid is said to be injected into the wound made by the stinging hairs. Is the irritation caused upon the skin of those who handle *Primula obconica* any different from what would be caused by a multitude of very fine pine or other splinters? Those who have traveled in the cactus region of Arizona and neighboring territories are well aware of the irritation that may be and often is caused by the entrance of minute spines into the skin, and do not need to consult a work on dermatitis venenata to learn if the order cactaceae has furnished, among its eighty-six genera, one or more species which have been

for investigation, that we may know the extent of the evil. Before it is too late it would be prudent for those microscopists interested in the study of minute plant structure to secure material while it is still to be had."

—In reply to B's request, published in April 1 issue, I give my experience in handling *Primula obconica*, having grown many of them for two years past. Last year I noticed a rash on men employed in working among these plants. This spring, a lady who had handled them in making bouquets, had a rash, coming out like "hives" or "nettle-rash." One of my workmen was also troubled in the same way after repotting and trimming the same kind of plants. The sores spread and are very irritating. They are so like "hives" at first, that people may very likely be treated for that, when really suffering from poisoning by the *Primula obconica*. Some may handle it with impunity, but I consider it a noxious plant. Parkdale, Ont. R. MEARNS.

—"B" in April 1 number, page 412, asks if "*Primula obconica*" is poisonous to the hands. A few years ago my wife poisoned her hands with the plants so that she was unable to sleep at night on account of the severe burning, and in order to soothe the pain would bathe her hands in cold water and hold them out in the cold. At first we did not know the cause, after awhile it became apparent, and then I would not allow her to touch the plants. Subsequent experience showed that by bathing the hands in a solution of carbolic acid, after handling the plants, the poisoning was prevented, and now she can handle them with impunity. The secret I think, is that the plant is poisonous in contact to persons having humor in the blood—as salt rheum—otherwise it is harmless.

McK.

—Regarding *Primula obconica*, Mr. Geo. Heil the florist and his first assistant Mr. Freeman, have of late been troubled with what the physician at once pronounced "poisoning by some plant." I feel certain that it was *Primula obconica* that did the mischief.

Toledo, O.

O. SCHROETER.

—In answer to B, would say that last month I was troubled with what the physician thought might be eczema, but nothing seemed to help me. Seeing a note regarding *P. obconica* being poisonous I watched, and found that every time I touched a plant of this primula I had an extra "swell" upon my hands and face. I ceased touching it and merely looked at it. Even that caused an itching and finally I kicked the plants pots and all out on to the rubbish pile. Have had all I want of *P. obconica*.

Lynn, Mass.

C. W. LEWIS.

—I have also been poisoned by *Primula obconica*. Am of the opinion that the leaves and not the flowers do the mischief, and if this is the case, no harm would result from handling the flowers in making up designs. I find that sol. carbolic acid is an effective remedy. Worcester, Mass. A. H. LANGE.

OUR NEW TRADE DIRECTORY is now ready. It gives a complete and accurate list of the florists, nurserymen, and seedsmen of the United States and Canada, designating the special branch of the trade each one is engaged in. Price \$2.

THE Missouri State Hort. Society will meet at Poplar Bluff, Mo., June 3, 4 and 5.

MAGNIFIED LEAF-HAIRS OF PRIMULA OBCONICA [FROM GARDEN AND FOREST.]

made a drawing of a fragment of a leaf as it appears under a microscope. This shows the hairs which fringe the margins of the leaves and the calyx-lobes. The large projection in the engraving is one of the teeth upon the margin of the leaf. The surface of a leaf shows some hair like those on the margin, others much shorter and some much longer and weaker. The hairs upon the petioles, so long as to give them a shaggy appearance, present, under the microscope, a great variety in appearance. The hairs are seen to be made of many cells placed end to end. These cells are oblong in outline and diminish slightly in size from the base upward. Frequently one of these cells is much narrower than the one above and the one below it, appearing like a mere stem connecting two parts of the hair. This occurs in no particular portion of the hair, and sometimes there are two constrictions of this kind in the same hair. In many plants the cells have a deposit of silica. This is the case with *Primula obconica*. If a portion of a leaf, including a portion of the margin, or of the calyx, be simply boiled in nitric acid, the contents of the cells will be removed, leaving a skeleton of the cells in silica, and in this *primula* the hairs are shown to have a silicious skeleton. All traces of the acid being removed by abundant washing, the specimen may be mounted. The large proportion of silica in the hairs of this *primula* would tend to render them brittle; it

known, upon good authority, to produce some degree of inflammation of the skin by contact. The one thing needed in the case of *P. obconica* is a careful investigation as to the character of the disturbance it causes and how it produces it. If, as now appears probable, the hairs with which the plant is abundantly provided are the cause, do these hairs inject any acid liquid or other substance into the skin? Though contact with the plant is said to produce skin-poisoning, is there any proof of the presence of a poison of any kind as that term is generally understood? What proportion of those who handle the plant are unpleasantly affected? Are persons of a peculiar habit or complexion more susceptible to its effects than others? If these points appear trivial, it should be considered that no plant has been introduced into cultivation in a long time possessing so many elements of popularity as *P. obconica*. It is of great value to the florist, to whom its ready propagation, its abundant and continuous bloom and its adaptability to bouquet and decorative work all commend it. But to the amateur cultivator and lover of plants, whether he cultivate it in the window garden or elsewhere, it is an almost perfect plant. In view of its irritating qualities, some conscientious florists have ceased to offer it for sale, and it promises to pass out of cultivation altogether. With the hope of averting what would be a floral calamity, I plead

Steam vs. Hot Water.

In the April bulletin of the Hatch Experiment Station of the Massachusetts Agricultural College, Amherst, Mass., appears a report of a second experiment upon the comparative value of steam and hot water for greenhouse heating.

The report says: "Much discussion having been provoked relative to the results of our experiments with steam and hot water for heating greenhouses, reported in Bulletin No. 4 and 6, and especially as to the accuracy of the results, we have the past winter made a careful repetition of the experiments to correct any errors that might be found and to verify previous results. The boilers have been run with the greatest care possible from December 1, 1889 to the present date, March 18, and every precaution has been taken that no error should occur."

Then follows a table giving the temperatures of the two houses, taken three times daily. The summaries are given below.

SUMMARY FOR HOT WATER BOILER.

Total coal consumed from December 1, 1889, to March 18, 1890, 6,598 lbs. Average daily temperature for the time, 48.39°.

SUMMARY FOR STEAM BOILER.

Total coal consumed from December 1, 1889, to March 18, 1890, 9,784 lbs. Average daily temperature for the time, 48.39°.

We give the remainder of the report in full with the exception of the table of sun temperatures.

REMARKS.

The following criticisms have been made by parties not conversant with the facts of the case:

1st. That the piping and check valve were not arranged so as to get the most perfect circulation of steam without a great loss of fuel.

2d. That the flues from the two boilers entered the chimney in such a way as to give a better draft to the hot water boiler.

3d. That the exposure of the two houses was such that the house heated by hot water received more sun heat than the one heated by steam.

These criticisms we think we can answer to the entire satisfaction of all fair-minded readers.

PIPING AND CHECK VALVE.

By numerous test examinations we have found that the circulation of steam through all the pipes, above the water line of the boiler, is perfect whenever there is fire enough to create steam in the boiler—that the check valve must consequently work easily and that there is never any standing water in the return pipes above the water line of the boiler.

FLUES.

The flues are arranged so as to give as nearly equal draft to the boilers as is possible and have them enter the same chimney and enter at the same point, and if there is any difference in the draft of the two it is in favor of the steam boiler.

EXPOSURE TO SUN HEAT.

It was suggested by the late Mr. Geo. Hills, of Arlington, that, perhaps, from their location, the steam heated house received less sun heat than that heated by hot water.

To test this matter two standard thermometers were placed in each house so that the sun's rays should fall upon them equally in both houses at the same time,

one on the eastern and one on the western exposure.

Records were made three times each day for twenty days, ending March 18, [the table shows an inappreciable difference in the sun temperatures of the two houses.—Ed. A. F.] Of these twenty days about eleven days were cloudy and nine clear and probably the period of time under observation was long enough to show that the amount of sun heat received by each house is so nearly equal as to, in no way, change the results given in the temperatures of each house.

Steam Heating.

I have often thought I would write on the subject of steam heating such as we have in use here, now I do so, and also answer J. Ralph's question of how long a steam heating apparatus can be left with safety without attention. Steam has been in use here six years (I have had charge four years) for heating about 4,000 square feet of glass, devoted to growing a general assortment of ornamental and bedding plants, roses, grapes, etc., such as are usually grown in private places. It also heats stable and carriage house (under part of which boiler is situated), and employer's large dwelling house 300 feet away from the boiler. The boiler we use is a 42 H. P. horizontal tubular, dampers all work automatically and can be adjusted to any number of pounds pressure we desire, we usually run five pounds. With this low pressure and large slow fire we can leave fire without attention from 12 to 24 hours. Before putting in this steam boiler we had in use three hot water heaters for greenhouses, large stove in stable and a steam heater in dwelling house. Now one fire does the work more satisfactorily than five did formerly. The only fire in employer's dwelling is in kitchen range. We have here economy in labor, it is easier to care for one large fire than five small ones in as many different places. We also economize in coal; we use now what is known as yard pea, the cheapest coal, formerly used stove and egg size. Mr. S., my employer, told me he saved the price of the boiler the first two years on the difference in the price of the coal. Then there is another thing to consider, there is no dust from coal and ashes working up through the house, as is always the case where apparatus that supplies heat for house is in the cellar under the house. Taking all things into consideration, I think we have here one of the most perfect arrangements for heating there is in existence, and as simple to care for as an ordinary hot water heater, as all we have to do is to clean fire once a day and put in coal and water and it takes care of itself.

WM. J. ROWE.

New Haven, Conn.

—In the last issue of the FLORIST, H. Grant has stated that he can leave his fire 12 hours without attention, also that after coaling up and then covering with three inches of ashes he can get steam up in from 15 to 20 minutes. I would ask Mr. Grant how many feet of pipe the boiler supplies with steam. If his fire burns quick enough after the way he fixes it to get up steam in 15 or 20 minutes I would like to know how it could last 12 hours.

JOHN P. RING.

Williamsport, Pa.

—In reply to Mr. Ralph's inquiry as to how many hours florists can leave their steam boilers without attention. I wish to state we can run ours eight or ten hours, according to the fuel and weather, and could leave it 12 hours if

some one else paid for the coal. Mr. R.'s inquiry covers more ground than appears on the surface. At first glance it is like asking whether it is right to water your plants every day. You would answer that depends on circumstances, and the success of his boiler depends on the same uncertainties. First, is your boiler large enough; second, have you grate surface enough; thirdly, have you exposed sun faces about your boiler and pipes that you don't want to heat? If so cover them up. What kind of coal or other fuel do you use? How many pounds of steam do you carry? Is your bridge wall close enough to the boiler? And so on with these and a score of minor points, which taken collectively will certainly insure failure. You have to learn to run a steam boiler and it is doubly hard after using hot water. You will get more information from some one that has put in steam and paid dearly for their experience than you can from steam fitters in general, whose only aim seems to be like that of the famous Cummencation Office, to show people "how not to do it." The experience that we have cost us \$500 more on the original price than it would have done if we had had the experience I now think we have. My advice is to see some one that has steam working successfully in their place and to be shown points with explanations and you will come out all right in time. We would not exchange our steam for any hot water system we have yet seen.

Penbody, Mass. MILBURN P. WARD.

OBITUARY.

DR. GEORGE THURBER, one of the most accomplished botanists of the country, died at Passaic, N. J., April 2. He was born in Providence, R. I., September 2, 1821. In 1850 he was one of the special commission appointed by the Government to Mexico and took part in several of the sensational skirmishes with the Indians. While there he began those researches in botany that afterward made him famous. In 1853 he went to New York, where he received an appointment in the assay office, but in 1856 was forced to resign on account of his Abolition sentiments. In 1859 he was appointed professor of botany and horticulture of the State Agricultural College, Lansing, Mich., and while there he revised Dr. Darlington's "American Weeds and Useful Plants." In 1863 he accepted the editorship of the American Agriculturist, and retained that place until 1885, when failing health caused his retirement. During his twenty-two years' service as editor, he had sole charge of all works on horticulture published by the Orange Judd Company. He was also the author of all the articles on botany and horticulture now to be found in Appleton's Encyclopaedia.

WASHINGTON, D. C.—A stranger whose name was given as John Thompson died at the Alexandria Infirmary recently. He was found in a railway cut seriously injured and from then to the time of his death he was incoherent in speech and generally asleep, but from his talk it was gathered that he lived in Philadelphia and that he was a gardener.

MR. R. V. VAN ZANTEN, of G. V. Van Zanten & Co., Hillegom, Holland, is on his annual trip through the States in the interest of his house.

OUR NEW DIRECTORY of the florists, nurserymen and seedsmen of the United States and Canada is now ready. Price \$2.

News Notes.

NEW YORK.—It is reported that Florist C. F. Klunder has returned from Europe.

SPRINGFIELD, O.—Messrs. Good & Reese the florists, recently suffered a serious loss by fire.

PASSAIC, N. J.—Easter trade in cut flowers was excellent. Prices good. Pot plants not so good.

PHILADELPHIA.—Mr. Harry Bayersdorfer, of H. Bayersdorfer & Co., sailed for Europe on the steamer City of Richmond April 30.

SAN FRANCISCO.—The annual spring show of the California State Floral Society will probably be held at Irving Hall, this city, May 20 to 23 inclusive.

BRADFORD, ILL.—A recent hailstorm destroyed about 3,000 feet of glass on the greenhouses of M. R. Saunders. Single and double thick fare about alike. No insurance.

NEWTON CENTER, MASS.—The exhibition of the Newton Horticultural Society will be held about June 20 in Associates Hall. The sum of \$130 has been appropriated for prizes.

OMAHA, NEB.—Easter trade much larger than last year. Increased call for all flowers, especially for fine roses. Prices same as last year, supply short, quality good. Good demand for blooming plants.

RICHMOND, VA.—W. A. Hammond has moved to his new store at 107 East Broad street. J. Harry Harvey is building a large range of houses in another section of the city, where he will move soon.

DEADWOOD, SO. DAK.—C. Buettner has discontinued his florist business, closing out his stock of plants and selling his property. Cause is stated to be the low prices for florists' products and high prices for everything else which prevail here.

RICHMOND, IND.—Hill & Co. have sold their catalogue and local city business to Gause & Bissell who will continue the same. Hill & Co. intend devoting their entire time and attention to the wholesale plant business and to the raising and dissemination of new plants.

GREENVILLE, O.—James Frost, formerly in the employ of W. W. Green, Son & Sayles, Watertown, N. Y., has purchased the greenhouse property of E. Y. Teas here and will conduct the same. Mr. Teas will give his entire attention to his bulb and nursery business.

ROCHESTER, N. Y.—Easter trade about 20 per cent larger than last year. Prices were lower, but not too low—last year they were too high. Supply was not quite equal to demand, sold out very clean. Quality of flowers was below that of last Easter. Good demand for blooming plants.

BALTIMORE.—A heavy hail storm smashed a lot of glass in this city the afternoon of April 27. The signal officers say that it was the worst hail storm on record in this country. Some of the stones weighed three and four ounces and they crashed through plate glass nearly half an inch thick.

CLEVELAND, O.—Easter trade was probably one third larger than last year with prices a trifle higher. Quality of flowers was good, especially lilies, which were very fine. An increase in the call for

blooming plants, any well flowered plant sold rapidly and for a good price. Less call for baskets, loose flowers being the main demand.

WASHINGTON.—At the recent dinner given by the Pan-Americans to President Harrison, a cluster of roses on the table in front of one of the distinguished foreign diplomats, in its arrangement so pleased him that he had it photographed the following morning to be sent abroad to one of the European Capitals as an art study and evidence of American skill in floral arrangement.

ST. LOUIS.—On Sunday, April 13, a heavy hail storm played havoc with glass structures at Kimmiswick, a suburb of this city. The storm lasted fully fifteen minutes, and some of the hailstones were as large as walnuts. J. W. North lost fully 12,000 lights of glass, and T. W. Guy lost fully one-half of his glass. No insurance. The loss will be heavy, coming as it does at this season of the year, the stock being badly cut and disfigured.

SAN FRANCISCO.—Easter trade was about 20 per cent larger than last year with notably increased call for Lilium Harrisii. Prices on cut flowers ruled about same as last year, quality better, supply equal to demand. Some increase in call for blooming plants. Out of door grown callas were plentiful and therefore common. Tree peonies and Lilium Harrisii brought good prices. Good plants of Harrisii brought \$1.50 to \$2 each.

CINCINNATI.—Mr. Frank Huntsman has associated with himself Mr. C. L. Mitchell, and the business will be continued as the Huntsman Floral Co. Mr. Harry L. Sunderbruch has withdrawn from the firm of A. Sunderbruch & Son, and will spend a few years on his farm at Williamsburg. Mr. A. Sunderbruch has also withdrawn from the firm, and the business will be continued by the younger sons under the firm name of A. Sunderbruch's Sons.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant ads. not admitted under this head.

SITUATION WANTED—In commercial place by a gardener of 25. For particulars address H. C. care American Florist, Chicago.

SITUATION WANTED—As gardener; 15 years' experience in 1 series and greenhouses. References given. Address S. M. care Am. Florist.

SITUATION WANTED—By florist and gardener, good propagator of roses and general stock; commercial or private place. P. M. W. Way, Twin Oaks, Pa.

SITUATION WANTED—By married man, age 33; 15 years experience in the cultivation of fine stock and greenhouse plants. Orchids a specialty. JOHN BANSLEY, 71 Borden ave., 11 City, N. Y.

SITUATION WANTED—By first class gardener and florist, good orchid grower; commercial or private place. Best of references can be given. Address O. F. care J. Fonta Horst and Webster Sts., New Orleans, La.

SITUATION WANTED—By a single German florist and gardener, 30 years of age, sober and industrious, 15 years experience in growing roses, carnations and all kinds of cut flowers for market. Address W. L. box 55, Commerce, Ill.

SITUATION WANTED—By a practical florist, single 15 years experience in Germany and England, good experience in propagating, plant growing, making up designs; no objection to private place. Address OSCAR SCHULZ, New York City.

SITUATION WANTED—By practical florist; young man; single; 6 years experience in growing roses and all greenhouse stuff for cut flower market and shipping trade; makes and lilies designs. Good references in the North and South. Address E. L. care American Florist, Chicago.

SITUATION WANTED—By a practical gardener and florist, competent in all branches, care of gentleman's private or commercial place; first class rose, carnation, violet grower; married; age 35; best references. Address W. G. 313 Meeker ave., Brooklyn, E. D., N. Y.

WANTED—Gardener, single man that understands care greenhouse, lawn, good rose grower, etc., quiet private place. Box 5, American Florist.

WANTED—Reliable young working florist who thoroughly understands cut flower growing in bulbs, etc.; steady place for right party. Address CHICAGO GROWER, care American Florist.

WANTED—Gardener married man, no children, who is capable of taking charge of greenhouse department; must be a first class rose and cut flower grower and a good plantman. Apply enclosing copies of testimonials and wages expected to. S. S. BAIN, 48 Beaver Hall Hill, Montreal.

WANTED—Man to take charge of greenhouses in cemetery; must be thoroughly posted on propagation and growth of cut flowers and bedding stock, and must write and speak English well. A permanent paying position for a capable energetic man. Young man preferred. Address L. C. care American Florist.

FOR SALE—One Hitchees No. 1 conical boiler, in use 3 years. Price, \$35.00. M. R. SAUNDERS, Bradford, Ill.

FOR SALE—Florist business; city 30,000 inhabitants. Solenoid retail trade in and out of city. Well stocked and equipped. For rent or for sale. Particulars, address C. C. care American Florist.

FOR SALE—Half interest in a first class commercial place with all modern improvements in one of the best west. etc. cities. Falling health is the cause for wishing to sell. Address J. C. care American Florist.

FOR SALE—Florist business in Indiana town, 15,000 inhabitants. 3 greenhouses, well stocked, heated with hot water; beautiful residence containing 10 rooms. Good reason for selling. Address K. care American Florist.

FOR SALE—Florist and seed store, with 5,000 feet of glass on three houses, heated with hot water, with a full and complete stock of plants; prominently located in the center of the city, five minutes from depot; and everything. For rent or for sale. A good trade in the way of making up decorations and funerals. Reason for selling, want to go west. For particulars, address J. BROS., P. O. Box 212, S. & 40 West Scott Place, Elizabeth, N. J.

FOR SALE—A well appointed wholesale floricultural establishment, 3,000 square ft. of ground, covered with glass, in a lively suburb of New York City. All cut flowers are sold on the premises to first-class retailers, and the demand exceeds the supply. Excellent reasons given for selling. Price, \$30,000, one-third cash, balance on bond and mortgage. For particulars address THOS. W. WEATHERS'S SONS, 46 and 48 Marion Street, New York City.

FOR SALE—A grand opportunity to any one about building greenhouses. The undersigned will sell (with or without interest) the entire plant at a great bargain, consisting of about 2 1/2 acres of glass, 700 feet of ventilating apparatus (Hitchings & Co.), 1,000 feet of 4-inch pipe, two No. 1's, one No. 15, one No. 16 and one conical boiler all in first-class order, and made by Hitchings & Co. Houses only been built a short time. If further particulars apply to J. BROS., P. O. Box 212, South Orange, N. J.

FOR SALE—A good paying florist business in a western city of 20,000 inhabitants with 10 different railroads running into same. 3 greenhouses built 3 years ago and heated with hot water, one-half acre of ground, hydrant water, fine dwelling house with 8 rooms, barn, etc. Ground and houses can be leased or sold. Terms and cash terms. Stock must be sold for cash; stock consists of all A No. 1, selling stock, no trash, amount of cash required about \$2,000. Good local and foreign trade established. For full particulars address C. American Florist, Chicago.

TO LET.

For a number of years, a most desirable florist and nursery establishment on Long Island, N. Y., being an old stand and within a few blocks of the elevated railroad station, to be let for a long or short time and bridge. The place consists of about 3 acres of very good soil, well stocked with young trees, shrubs, vines, etc., etc. There are also a number of old frames, etc., etc. all well filled with good reliable plants. Being in the proximity of all the principal cemeteries, a large and steady business is done in bouquets and floral designs. Any good, competent gardener need apply. Four months is the reason. For further particulars apply to HENRY MILLER, Florist, East New York, Station E, Brooklyn, N. Y.

Public Sale
of a valuable FLORIST BUSINESS, at
CATONVILLE, MD.

3 miles from the limits of Baltimore City. Business established 22 years. The proprietor wishes to retire from business. Will sell at Public Auction.

ON TUESDAY, MAY 20th, 1890,

At 10 o'clock A. M.,

His valuable Florist business at Catonsville, Md., including dwelling house, 3 greenhouses, 5,000 and 6,000 feet of glass are well stocked with plants, perfect system of heating, and a fine orchard, with about 1,500 ft. of 4-in. pipe 3 wells of water, has a tract of land with a frontage of 351 and a depth of 14 feet, with privilege of purchasing water with 1 mile of walk of steam or horse railway. Abundance of small fruit and shrubbery on property. Will sell stock with the property or separately.

ANDREW BASSLER,

CATONVILLE, MD.

Coming Exhibitions.

June 24-25, Boston.—Rose and strawberry exhibition Mass. Hort. Society.

August 19-22, Boston.—Annual exhibition Mass. Hort. Society.

October 28-Nov. 1, Atlanta, Ga.—Chrysanthemum show, Piedmont Exposition Co.

November 4-6, London, Ont.—Chrysanthemum show, Gardeners' and Florists' Club of London.

November 10-14, Philadelphia.—Chrysanthemum show, Penna. Hort. Society.

November 11-13, Boston.—Chrysanthemum show, Mass. Hort. Society.

November — — — Chicago.—Chrysanthemum show, Chicago Florist Club.

November — — — Cincinnati.—Chrysanthemum show, Cincinnati Florist Club.

November — — — Indianapolis.—Chrysanthemum show, Society of Indiana Florists.

November 11 — — Montreal, Canada.—Fall show Montreal Gardeners' and Florists' Club.

November 12-13, Worcester, Mass.—Chrysanthemum show, Worcester County Hort. Society.

Chicago.

Chas. Reissig has removed to 318 Wabash Ave., in the Auditorium Building. J. D. Reynolds is preparing to entirely rebuild his greenhouse plant at Riverside.

The present system of marketing cut flowers was vigorously discussed at a recent meeting of the Florist Club, and the announcement of the subject for debate brought out a phenomenally large attendance. Mr. J. D. Reynolds arraigned the present system and Mr. C. H. Fisk defended it. The discussion soon became general and was at times rather warm.

A meeting of the florists and growers of Chicago and vicinity was held the morning of April 26 "To consider the expediency of establishing a general market or flower exchange association, whereby the relations between buyer and seller may be made more satisfactory than at present, and prices so adjusted that they shall be uniform to all, and the 'fakir' deprived of certain advantages he now possesses." There was a large turnout to the meeting, and after considerable discussion a committee of seven, consisting of Messrs. J. T. Anthony, F. F. Bentley, J. D. Reynolds, F. Kennicott, E. H. Hunt, M. F. Gallagher and G. L. Grant, was instructed to formulate a plan for an association or exchange and submit the same to a subsequent meeting to be held Saturday, May 10, at 10 a. m. in the club room of the Sherman house.

ORANGE, N. J.—Ernest Porsch, of Hamilton street, will soon build a new rose house, 100x20, and Henry Decker of Center street is building one 180x20 feet. Mr. Decker grows his roses in solid beds, and is a firm believer in that system. Alfred Hibbins, Dood street, East Orange, will build a carnation house 120x16 and a propagating house 120x8. John McGowan will soon erect a new house 100x18 for his new carnation Lizzie McGowan. Jacques Bros. are trying to dispose of their greenhouses and store with the intention of retiring from business.

20,000 HEALTHY YOUNG ROSES.

Good, strong plants of leading sorts for florists' use, now ready. Write for prices.

WE HAVE NO BLACK SPOT ON OUR PLACE.

THE FLORAL EXCHANGE.

THE AMERICAN FLORIST CO., Chicago.

THE FLORISTS' CLUB of Philadelphia has appointed a committee to purchase property upon which to build a suitable club house. It is proposed to have a library, meeting and reading room, and a banquet hall, also rooms for billiard tables and a bowling alley. It is also intended to make the clubhouse a central exchange for all kinds of florists' supplies, and bulletin boards are to be placed in every room, on which members can give notice of stock wanted or for sale. It is also proposed to establish there a wholesale cut flower market and endeavor to induce certain classes of the trade, such as basket makers and wire workers to locate there.

THE SECRETARY of AGRICULTURE has issued a circular, No. 5 of the Forestry Division, giving instructions on tree-planting for purposes of Arbor Day. The circular which is a reprint of one compiled last year by Prof. B. E. Fernow, chief of that division, is intended primarily for use in eastern states, but the general principles stated to be observed in the choice of trees, the treatment before transplanting, the method of planting and after-care are applicable everywhere, the only difference for other regions being the choice of season and of kinds to be planted.

WILL Chicago size up to the World's Fair? That is a question often asked, and answered according to personal prejudice, mostly. Our concern is that the "windy city" gives horticulture its proper place in the fair, to do which she will have to "get a move on," in slang phrase, pretty soon.—*N. Y. Trade Journal*

Would the T. J. kindly mention some nice American city which today has more of a "move on" in a public horticultural way than Chicago? A short list will do.

WE HAVE RECEIVED from Mr. A. S. Lowden, Pittsfield, Mass., a leaf of the spotted calla (*Richardia albo-maculata*), the lower part of the blade of which is almost pure white, while the point still retains its normal appearance. A flower is also sent which has an abortive leaf springing from the base of the spadix, the flower being otherwise perfect. It is of interest merely as additional evidence to support the theory that the parts of a flower are simply changed leaves.

A NEWSPAPER correspondent states that "Eastern capitalists" are making preparations to place Florida out door grown flowers in northern markets, and describes the scheme as one "That promises millions for the nurseries of the south." In the meantime southern florists continue to send north for fine roses and similar flowers because they can not secure sufficient stock of first quality at home during the same periods that flowers are scarce at the north.

THAT ever shifting, ever stretching "hail belt" has again displayed its remarkable elasticity. As if to prove its capability in this direction it drops an icy reminder on St. Louis and Baltimore almost simultaneously. The "belt" is quite as ubiquitous as the oft described "sea serpent" or the shadow of the "Flying Dutchman" on the high seas.

IT IS NOTABLE that in the numerous reports of glass broken by hail, the almost invariable conclusion is "No insurance." Seems as though the members of the Florists' Hail Association have a mascot at that organization. Certainly those belonging to the Association have been remarkably fortunate in escaping losses.

IMPORT DUTY ON PLANTS.—There seems to be some difference of opinion as to the advisability of an import duty upon plants as proposed in the bill now before Congress. It is to be hoped that all have made use of the blank mailed in last issue, to express their opinion to their Congressmen—the men whose votes will determine the matter.

CHRYSANTHEMUM "Orange Beauty" is the name given by F. Morat's Sons & Co., Louisville, Ky., to a new chrysanthemum of which they have sent us specimen flowers. The blooms are about three inches in diameter, well formed, of an orange yellow shade, and borne in clusters. It gives promise of being useful.

REGARDING the craze for rare varieties among wealthy collectors of orchids, a factious Frenchman, after an examination of several great rarities, declared that "The uglier they are, the lovelier they are."

ORCHID JEWELRY is the latest novelty, a leading New York firm having reproduced a great variety of orchids in silver and gold decorated with gems. The color and form is described as remarkably accurate.

THE Biological School of the University of Pennsylvania boasts of 50,000 botanical specimens.

IT IS PROPOSED to establish at Washington a national park to contain thousand acres.

Catalogues Received.

G. J. Lambrigger, Big Horn City, Wyo., seeds; Nagel Greenhouses, Minneapolis, Minn., plants and floral work; E. H. Hunt, Chicago, florists supplies; W. J. Berger & Co., San Francisco, Cal., bulbs and plants; A. M. C. Jonkindt Coninck, Dedensvaart, Holland, plants and nursery stock; D. B. Long, Buffalo, N. Y., floral photographs; Wm. Clappelow, Monrovia, Cal., plants and nursery stock; W. W. Greer Son & Sayles, Watertown, N. Y., plants and bulbs; Wm. Paul & Son, Waltham Cross, Herts, England, roses and other plants.

Insects and Diseases.

Conducted by CHARLES F. BAKER, Agricultural College P. O., Ingham Co., Mich.
Send specimens of unidentified insects and diseased plants to him at above address.

Julidae and Wireworms.

Mr. W. L. Morris, of Des Moines, Ia., recently sent to the Am. Florist office some "worms" which he had found under pots and flats in the greenhouse. In places they were found to have injured the tubers of begonias. They were myriapods, commonly called "thousand legged" or "galley worms" and belonged to the family Julidae. These have a cylindrical body, with two pairs of legs to every segment except the first three. The entire number of legs may be anywhere from 150 to 240. Most of the species are beneficial, feeding on injurious insects and decaying vegetable matter, but some are injurious to cabbages, potted plants, the roots of wheat, tubers, garden flowers and many other plants, although they are scarce.

Their minute eggs are laid from Christmas to the middle of spring, near any decaying vegetable matter. They frequent dark and damp places and when disturbed coil themselves into a spiral like a watch spring, at the same time emitting a strong odor. This odor is produced by glands inside of the body, the openings of which on the sides resemble the breathing pores, and can be seen only by the aid of a microscope. As it takes two years for them to attain maturity, they can be readily exterminated if the remedies are persistently applied. Artificial heat and hand picking are the most certain. Sprinkling soot on the benches or shelves has been tried with success. Spraying with kerosene or crude oil would also undoubtedly kill these as it has many insects living in similar situations.

The Julidae are often mistaken for wireworms. The wireworms are the larvae of snap beetles, or more properly, elaters, and have long, hard, cylindrical bodies, which are pale testaceous or yellowish red in color. They have only six true legs, and a slight anal pro leg. The body is flattened towards the head and tail. Their habits being so well known, the remedies so many and varied, that as the florist rarely has them to deal with they will not be discussed further here.

Duty on Bulbs—A Test Case.

Florists from all over the city and out of town crowded the United States Circuit Court room, where Judge Lacombe was sitting yesterday afternoon trying the test case of August Rolker's Sons against the government, to recover \$2,700 which they claimed had been illegally collected from them by Collector Daniel Magone as duty on certain importations of flower bulbs.

This firm imports thousands of bulbs of hyacinths, gladioli, daffodils, tulips and the like, on which the collector has exacted a duty of 25 per cent, claiming that they should be classified as "bulbous roots that are not medicinal." The Rolkers brought suit to recover on the ground that the bulbs should be admitted free, as they were "bulbs not edible nor advanced in value by process of manufacture," which the tariff act says are not dutiable.

The jury returned a verdict for the government.—*New York Herald, April 22.*

AMERICAN FLORIST CO., 54 La Salle St., Chicago.

FLORAL DESIGNS.

A book which tells how to make them and shows how they look. Fifty tinted plates of approved designs, in fine shape for showing to customers in place of the bare wire designs; it "gets there" much better, and looks pretty while doing it. It is a good investment for any working florist at \$3.50, postpaid, and can be had of

J. HORACE MCFARLAND,
Box 55. HARRISBURG, PA.

Any one with a cellar or stable can do it. Our pamphlet, "How to Grow Mushrooms," gives full instructions. Send for it. A trial brick of Mushroom Spawn (enough to plant a space 3 ft. by 4 ft.) sent by mail, to any address for 25c. 10 lbs., by exp. for \$1.20. 50 lbs. for \$5. Our handsomely illustrated catalogue of Vegetable, Flower, and Farm Seeds, and all requisites for Farm, Garden, and Lawn, free to all.

JOHN GARDINER & CO. 31 North 13th St., Phila., Pa.

Florists' Letters.

Emblems, Monograms, Etc.

These letters and designs are made of the best immortelles, wired on wood or metal frames, having holes drilled in them to insert tooth-picks, by which they are fastened to the design. Give them a trial. You will find these goods to be Superior to any in the market. PAT'D AUG. 6, 1889.

NOTE.—All infringers or imitators of the above letters and designs will be prosecuted to the fullest extent.

Robt. S. Brown & Son

BOX 99.

KANSAS CITY, MO.

The "PLANET JR."

" SEED DRILLS
WHEEL HOES
HORSE HOES

The "PLANET JR." No. 2 GARDEN DRILL, is beyond question the best; sows the most difficult seeds; opens, covers, rolls down and marks the soil row with the greatest regularity.

The COMBINED BELLY and HOE & C. The greatest favorite ever produced. Perfection as a Seed Drill, or as a Plow, Hoe, Garden Rake, Cultivator or Marker. Saves labor and seed and soon saves cost.

The DOUBLE WHEEL HOE. A money maker for farmers and gardeners. Works both sides of a row at once. Plows to or from, opens furrows, covers, cultivates, hoes, rakes and has leaf guards.

DOUBLE WHEEL HOE PLAIN. Same as last, but has one pair of hoef only.

The SINGLE WHEEL HOE is a treasure. Beats the double in some crops; is lighter. Has a Large Plow, two Long Rakes, two Rakes, three Cultivator Teeth, and a Leaf Guard.

The FIRE-FLY SINGLE WHEEL HOE. Equals the last, except has no rake or leaf guard.

The FIRE-FLY GARDEN PLOW. Worth its price yearly in a garden 20x40 feet.

The GRASS EJECTOR. The newest, simplest, cheapest and best machine for edging paths and flower beds.

The 1890 HORSE HOE. The finest tool and most costly to make that we have ever offered. Yet the result justifies our care, as every one who sees the tool will admit. The first grand improvement in our new patent Lever Ejector, since 1870, when we first introduced it. It is now a perfect horse hoe, and has no equal in the world. Our patent Handle Shifter, enabling one to walk to one side of his work; worth \$3.00 a day for some crops. Yet we ask but a small additional price for both these fine features. Why not send for full descriptive catalogue and these and all our other farm, garden, and household tools, and see for yourself the real metal improvements? Free to all.

JOHNSON & STOKES,

217 and 219 Market St., Philadelphia, Pa.

Spiraea (Astilbe) Japonica Aurea Reti-
culata.

I had a quantity of the golden variegated *spirea* in bloom this Easter and would say that as a pot plant it surpasses the green variety in every respect. Not only does the variegated foliage improve the general appearance of the plant, but the numerous flower spikes are also more robust and of greater size, under the same treatment, the same soil and grown in the same house with the green ones. I merely write this as a hint to some of our florists who have given up growing any *spirea*. There is certainly a far better chance for the variegated form to sell than for the green one, for the plant looks grand even without the flowers and the foliage keeps the golden yellow color in all the veins for months until the scorching August sun bleaches the yellow into almost white.

Rochester, N. Y. JOHN B. KELLER.

Araucaria Imbricata.

In the AM. FLORIST of March 1 appears a report of a paper read by Mr. S. Henshaw before the New York Florist Club. Mr. Henshaw makes an error, I think, when he states that *Araucaria imbricata* is a native of Norfolk Island, as it is a native of Chili and generally known as the Chilean Pine. *A. imbricata* and *A. brasiliensis* being the two natives of the American continent. *A. excelsa* is the true Norfolk Island Pine. *A. Bidwillii*, *A. Cookii*, *A. Cunninghamii* and *A. Rupei* all come from Australia and that part of the world.

NARCISSUS.

An immense collection and an enormous stock
of all the leading varieties, especially of those
adapted for forcing. Many acres of stock now in
flower, and I expect I shall have at least

A MILLION

of fine forcing roots to offer this season, and shall
be pleased to give prices for any variety for **EARLY
FALL** Delivery. A preliminary list has been sent
to my customers, and my General Trade Cata-
logue will be ready shortly.

CLEMATIS.

My stock for Fall delivery will be much heavier
than previous seasons. The varieties consist of
all the best kinds and may be relied upon. Also
many other varieties of Hardy and Half Hardy
Climbers.

PYRETHRUMS.

Many thousands of these are grown and form
one of the most important families of my Florist
Flower Department. Also Carnations, Phloxes,
Delphiniums, Pansies, Pinks, Hollyhocks, etc.

HERBACEOUS PLANTS.

The increasing demand for this group, both at
home and abroad, has necessitated my adding
several acres of fresh stock, in addition to my
usual stock which is immense. Every good hardy
plant is grown in large quantities, and I shall be
pleased to quote prices for anything required.

DAHLIAS.

An extraordinarily complete collection, every
variety of every section worth cultivating will be
found described in my Retail Catalogue, published
in April. Trade list of Pot Roots published in
the Autumn.

HARDY BULBS.

Many acres grown, forming the most important
branch of my Establishment. Anemones, Lilies,
Chionodoxa, Gladiolus, Begonias, Montbretias,
and hundreds of other families too numerous to
mention here.

INDUSTRY GOOSEBERRY.

I have a good stock of this for Fall delivery, and
shall be pleased to quote lowest price upon applica-
tion.

CHRYSANTHEMUMS.

Every variety up to date, including English and
Continental, full descriptions of which will be
found in my numerous Catalogues, which may be
had on application.

Hail Insurance.

THE EXTRA ASSESSMENT PLAN.

The efficiency of the extra assessment plan adopted by the members of the Florists Hail Association at Buffalo has been tested. Newby & Co., of Logansport, Ind., took out an extra whole assessment on their double thick glass, and their loss of 108 square feet of glass, on April 8th, was promptly paid for by the treasurer of the Association at the double rate of 14 cents per square foot. It looks very much as though the problem of plant insurance has been solved. So far, every step taken by the directors has been successful, and the machinery of the Florists' Hail Association works without the slightest friction. Sixteen new members were added the first twenty days in April.

JOHN G. ESLER.

Duty on Wheat Sheaves.

The New York *Herald* of April 18, says: "In the test case of Donat & Mishel, of No. 130 Greene street, against the government regarding the duty to be paid on bleached sheaves of rye, oats, barley and other grasses used for decorative purposes by florists, a jury in the United States Circuit Court brought in a verdict for the plaintiffs yesterday. The verdict is quite a victory for the florists."

PLANTS FOR THE SEASON.

During the bedding season many large plants are often required for baskets and piazzas. Special cheap list as follows. All will be found fine plants for immediate sale. ALL IN FIRST-CLASS CONDITION.

Palms.

- 12 Handsome plants, 1½ to 3 feet, in 5 and 6 inch pots fit for 7 inch now, 6 distinct sorts, \$5.00.
12 *Dracena Indivisa*, 6-inch pots, 2½ feet and over high, \$5.00.
12 Crotons, highly colored, 1½ feet, \$5.00.
12 *Gardenias* (Cape jasmine), 12 to 15 large buds just opening on each, \$5.00.

Small Plants.

The following will be valuable to all who put them on and fill up houses during Summer after bedding plants are sold. Will make fine plants in a few months.

Ferns.

- Adiantum Cuneatum* (Maidenhair), 2-inch pots, \$4.00
Ferns mixed, 20 best sorts, 2-inch pots, 4.00
" " fine, in 4-inch pots, 8.00

Palms.

THE GRAND NEW PINK CARNATION,

"Fred Creighton"

A rival of Grace Wilder, and conceded by experts to be one of the finest pinks ever raised, is now ready.

I have not space to give description here, but just two testimonials.

FISHKILL, N. Y., Feb. 18, 1890.

MR. GEORGE CREIGHTON, Dear Sir:—After a careful inspection of the house of your new seedling pink carnation "Fred Creighton," I am pleased to say they are as healthy and vigorous a lot of plants as I ever saw, and as well set with buds and bloom of the most perfect form and color as the most fastidious could desire. Yours truly,

J. G. BURROW.

36 East 23rd St., NEW YORK, March 3, 1890.

MR. GEORGE CREIGHTON, New Hamburg, N. Y., Dear Sir:—In reply to your favor of March 1 I containe your new carnation "Fred Creighton." I beg to say that I consider it in every way superior to Grace Wilder, both in habit of growth and positive color. It does not have that faded out appearance of Grace Wilder. Its long stems will make it particularly valuable to retailers. Yours truly,

W. S. ALLEN.

Heating.

Will some one who has the necessary experience please enlighten me on following matter: What size boiler (give length and diameter) will heat three houses each 150x10 feet in 10' above zero weather up to 75°? State whether double return is most economical. Shall I use 2 or 4-inch pipe, and how many runs to the house? Will it be necessary to sink the boiler, and how much? Where is best place to put expansion tank and the valves? Any further information that may be deemed necessary. Have no money to pay for experiments, therefore I want to know just what to do.

B. H. 1.

Killing Greenfly.

As several have given to the readers of the FLORIST their various methods of killing greenfly I mention a new method recommended by a young gent from an eastern city, who said he knew all about the flower and plant business. He said that his folks kept down greenfly by making a small fire in an iron vessel and burning the leg of an old boot in it. After unloading this advice he appeared to feel a little easier and bid me "good day." Of course I told him to "call again."

SCRANTON, PA.

F. R. PIERSON & CO.,

Tarrytown, New York, U. S. A.,

ORIGINAL AND LARGEST GROWERS OF

Lilium Harrisii Better known as The Bermuda Easter Lily

The Best in the World for Forcing Winter Flowers.

WE OFFER ONLY STRONG FIELD-GROWN BULBS FROM
OUR OWN GROUNDS IN BERMUDA.

THIS VALUABLE LILY IS OUR SPECIALTY.

We grow the bulbs by the acre on our own grounds in Bermuda. We were the first to grow it in large quantities and to offer it at reasonable prices, and we have always been recognized by the trade as

HEADQUARTERS FOR THE BERMUDA EASTER LILY.

Supplying the trade as we do both in this country and in Europe, and we hold by far the largest and the controlling stock of the genuine variety in the market.

The extent of our operations in this bulb alone will be best understood when we state that we expect to sell from OUR CROP of 1890, over a

HALF A MILLION BULBS.

Be sure you get the genuine Lilium Harrisii. In order to secure "the true variety," purchase your Bulbs from original stock, which is known to be pure. The value of this Lily has led unscrupulous or ignorant parties to plant L. Longitlorum in Bermuda, or grow it there one season and send it out as Harrisii, and dealers should look with suspicion on bulbs offered at prices less than market rates, as the supply has never yet met the demand; "Mixed Bulbs" only being offered at reduced rates.

This is not only the best by far of all lilies for winter blooming, but it is one of the most profitable flowers that can be grown by florists. It is very easily handled, and the flowers being especially effective for decorative purposes, always command large prices. From its name some have thought it was a bulb for florists' use for forcing for the Easter market only. This is not exclusively so; it derives its name from the fact that in Bermuda, grown in the open ground, it blooms at Easter time—hence the name "Bermuda Easter Lily"—but by growing it in the country in the greenhouse, with successive lots, it can be had in bloom all the winter from early in December until after Easter; in fact, by special culture, all the year round, or as long as cut flowers are in demand. The fact that it can be forced into bloom by the Christmas holidays adds particularly to its value, as it fills in at a time when flowers are usually scarce and in great demand at high prices, but to accomplish this the bulb must be potted early in August, something depending upon after treatment and temperature the bulbs are grown in.

For this purpose our Bermuda-grown bulbs are indispensable, as in Bermuda the bulb reaches its highest development, and ripens off perfectly, and is ready for shipment usually by the middle of July—before bulbs in our own country have hardly begun to make their growth. Our bulbs being grown in the open ground, in a climate naturally adapted for their perfect growth, are particularly strong and healthy at any time.

New Crop will be ready for delivery early in August. Orders booked for delivery at that date.

Large growers or dealers in this bulb should write us for special prices, stating quantity of bulbs desired, and we will give lowest estimate on the same by return mail.

F. R. PIERSON & CO.,

TARRYTOWN, NEW YORK, U. S. A.

THE TRUE BERMUDA EASTER LILY

BULBS

WE are now booking orders for Bulbs to be delivered in August, at lower prices than ever before offered. Write us for quotations, stating quantity you want. New York Depot, 136 W. 24th STREET.

BOXES. BOXES.
MAILING and CUT FLOWER BOXES.

Read what C. A. Reeser says for our 3-PIECE BOX:

GENTLEMEN:—I write to tell how well pleased I have been with the mailing boxes you have furnished me during the past two years. I think I have ordered 35 or 40 thousand, thus giving them an extensive trial. I think there is nothing in the market that is so satisfactory, at least, that has been my experience, and I have tested nearly, if not quite all the boxes in the market for that purpose.

Yours very truly, CHAS. A. REESER.

GREENHOUSE HEATING.

BY A. B. FOWLER.

Explains fully all the best systems of heating greenhouses by both hot water and low-pressure steam. Tells you the points to consider in selecting an apparatus. How to adjust same to various locations; gives the results of the latest scientific experiments. Shows how to compute the number of feet of pipe required for a given space; draft and other important matters. It is highly commended by Mr. John Thorpe and others. Postpaid, 75c.

Sent on receipt of price. Address,

A. T. CEFREY'S

Patent Improved
Florists'

Immortelle Letter and
Pin Fastener.

A. T. Cefrey

THIS Company takes an especial pride in presenting to the Florists of America, their Patent Improved Letter for Floral Work, invented, patented and perfected by Mr. A. T. CEFREY, the originator of the Immortelle Letter for Floral Designs, and who, for many years has occupied a leading position amongst his brother Florists for his original and artistic efforts in all that pertains to the floral profession.

We offer to our patrons a *FRENCH IMMORTELE LETTER*, perfectly made by machinery, and covered with *GENUINE IMPORTED FRENCH IMMORTELES*, in Violet, Blue, Scarlet or Pink. We send each separate letter enclosed in an envelope, containing, also, our patent *COVERED IMMORTELE PIN FASTENER*, which can be attached to the letter simply and expeditiously, and will hold the same securely and firmly in place on the design.

The beauty and symmetry of our goods have been the admiration of all who have seen them. Nothing equal to our letters has ever before been attempted. They are not only superior in workmanship, material and general excellence to the old *IMMORTELE LETTER*, but, what is of the utmost importance to florists, they are almost indestructible, being *made by a patent process*, almost as hard as iron, and we guarantee that they will stand transportation, and can be safely sent by mail or express to any part of the country.

It has been our aim to place our goods in the hands of the trade at rates, that, with their great advantages, will ensure for them a ready sale, and will also, from the unusually low prices, largely extend their use in the country.

Florists have heretofore experienced much loss and inconvenience in handling this class of goods, as, being exposed to the air, they lose their brilliancy of color. We enclose each separate letter in envelope, marked upon the outside with the name and color. Each package will be marked with a fac simile of the signature of the inventor, and all infringements will be prosecuted to the fullest extent of the law. 10 cents per hundred for postage.

The Price of the Letters, including the Pin Fastener, is \$2.00 per Hundred.

ADDRESS ALL ORDERS TO

CEFREY FLORISTS' LETTER CO.

37 TREMONT STREET, BOSTON, MASS.

Puget Sound.

SEATTLE, WASH.—Easter in this far away corner did not find the florists in the best of shape for good trade. The season was against them. Ordinarily they could have expected much more warm weather than was experienced previous to Easter and as a consequence the lilies were all backward. Callas were quite numerous and there were a few roses to be had and some hyacinths, but aside from that bloom was scarce. The reason is that all but two of Seattle's dozen florists have been in the business here about one year, so their stock is yet in the beginning stage.

AT TACOMA there are a number of florists doing good business though Mrs. A. R. Mann seems to be in the lead. She was tolerably well supplied with bloom for Easter though she was compelled to import some flowers to fill her orders. At least she tried to buy lilies here and found the supply inadequate to the local demand.

OLYMPIA, I believe, is an excellent place for a florist to locate. It is the capital of the state. People there have fine gardens in the summer, but as far as I can learn there is not a florist there who will supply blooms and decorative plants for the numerous legislative and political festivities.

PORT TOWNSEND is another good city for a florist to locate at, and so is Whatcom. Of course this whole country is overrun by nurserymen and their canvassers, but the places I speak of have no florists and the cities are growing rapidly.

IN ALL probability there will be a weeding out in Seattle, as there seems to be a large number of florists here for the size of the place. EDMOND S. MEANY.

PIPE AND BOILERS FOR SALE.

Having introduced steam in our place, we are willing to sell, at a low price, 8,000 feet 4 inch Cast Iron Pipe, and the following Boilers: 4 large Meyers, 1 large Hitchings, 1 Swayne, 1 Luck. Address THE FLORAL EXCHANGE, 614 Chestnut St., Philadelphia, Pa.

STANDARD POTS

made by the latest improved machinery, are better and cheaper than those made by the old way. Price, 1-6 B. cars here, free of charge:

BUFFALO.—On his way to Detroit the general secretary of the National society laid over a few hours in this city. Half a dozen of the Buffalo boys were ready to receive him, and he was soon engaged in a game of ten pins in the same alley where such illustrious lights as Messrs. Norton, May, "Papa Contier Anderson," "Cypridium Manda," "Hybrid Perpetual Roehrs" and others have played. Several toasts were indulged in and the meeting broke up most happily, with a slight tendency to anecdote. W. S.

Notes From Central Park, New York.

BY WM. FALCONER.

Being in New York on April 30 and having a little while to spare I visited Central Park to see the tulips and the spring flowers. The whole park was perfectly lovely.

Large beds filled with tulips occur outside of the main entrances to the park, and also in some of the principal squares in the city, and tulips, pansies, daisies and other transient plants have also been planted around the several buildings inside the park. These beds when the gay tulips are past shall be emptied of their present occupants and filled with summer bedding plants.

Central Park is so very extensive and its surface, naturally and artificially, is so varied and so rocky that great possibilities are afforded for tasteful and appropriate adornment with hardy flowers.

The moss pinks (*Phlox subulata*) red, pink and white, in broad solid sheets spread upon the brows of rocky banks have a striking effect even in the far distance, and upon coming up to it we often find that the carpet of phlox is only a part of the decoration of the rocky knoll. Associated with it on the driest crests are *Sedum* acre, and spread about are other sedums as *Nevii* and *ternatum* which love slight shade, *pulchellum* which renews itself from seed every year, *album* which blooms immediately after acre, *dasyphyllum* and *Hispanicum* which form close mats of glaucous blue and are prettier in leaf than in bloom, *spectabile* which blossoms in August and September, and *Sieboldii* which waits till September and October. Then there were other kinds of *Phlox*, as *amcna*, *rose-pink*, now in full bloom; *Stellaria*, a cushion of lavender, and *divaricata*, fragrant and purple. *Erysimum pulchellum* was a sod of golden yellow and shown off to much advantage when associated with *Arabis albidia*, the white rock cress, or *Iberis sempervirens*, also white, and both now in full bloom.

Carpets of violet and purple were supplied by *Aubrietia deltoidea* and its varieties. Although these are dwarf sod-forming plants they are very tenacious of life, extremely profuse and showy in quantity and they last in good bloom at least two months at a time. When grown near the white candytuft or white rock cress they were displayed to much better advantage than when grown alone; indeed white seemed almost imperative in proximity to pink or purple, but pink and purple or yellow and purple in pronounced quantity beside each other would be inharmonious.

Complimentary to these plants on the rockeries were many others of lesser effect. The *ajugas* were spreading in patches, the little *Veronica alpina* covered with

pale blue flowers scarcely rose above the ground, and the woolly *V. pectinata* was spreading about among the rocks. The yellow *Waldsteinia* was in good bloom, the starry white *Stellaria Holostea* was at home near the shrubby edge; *Iris pumila* and its forms found genial quarters on the lower slopes, hardy violets occurred wherever they could scatter their seed, and *dianthus*, *semperivirens*, creeping *gypsophila*, and many others not yet in bloom prevailed among the rockwork. Of the little *Saxifraga Virginensis*, which is indigenous there, large quantities were scattered among the rocks and in full bloom. *Epimediums* were also plentiful.

In preparation for planting out were quantities of many hardy plants, for instance, *Saxifraga granulata*, a pretty little European plant; *Gentiana acualis*, broad patches of which were in bloom, but the plants had a yellowish tinge; different species of *trilliums*, *tertensia*, hardy pinks, *Tellima grandiflora*, and a large number of later blooming plants. Besides these a lot of small ferns like *Cheilanthes tomentosa*, *Woodsia*, *Oregon* and the like were being gotten up for planting in the crevices of the rocks.

In making beds for hardy plants at the top of rocky declivities, and especially on the top of steep rocky bluffs a moderately broad margin of the natural sod is left undisturbed; this is to stop washing in rainy weather.

Quite a pretty feature in the park is the multitude of *erythroniums* and *dianthus* that abound in the woods, and the violets, *claytonias* and other flowers that are at home in the grass, and the preparation with *houstonias*, *trilliums*, *trollius*, *polygonatum*, etc. to add to them.

THE TULIPS.—The tulips were in all their glory and some massive beds, both in the city squares and near the park entrances were filled with them. Only three colors, namely, red, yellow and white, were used in a bed no matter how large it might be or how many thousands of plants it might contain. The plan of the bed herewith sent is that of the one at corner of 59th street and Fifth avenue, it is about 40 feet in diameter and contained 5,500 tulips. In it there is a solid circle filled with white *Pottelbakker*, then a band of *La Belle Alliance*, scarlet, surrounded with a heavier circle of *Canarybird* for yellow, and on the outside a heavy belt of *La Belle Alliance* again. The bed in City Hall Square is practically a repetition of this one, both in design and variety. The bed at 59th street and Eighth avenue was made up of the same colors, namely, *Pottelbakker*, white; *Yellow Prince*, yellow, and *Crimson King* for scarlet. It contained 10,000 tulips, but the design was different. The regularity of the tulips and the evenness with which they came up and blossomed

STILL twenty-eight pages.

DECORATION DAY is at hand.

ARE you in good shape for the spring plant trade?

BOSTON proposes to royally entertain the delegates to the coming convention.

FROM PRESENT indications there will be a larger attendance at the Boston meeting than at any previous convention. Every one wants to visit the Hub.

ARRANGE your business plans now so that you may safely be absent for a week or ten days in August, for you can't afford to miss the Boston convention.

OUR NEW TRADE DIRECTORY is now ready. It gives a complete and accurate list of the florists, nurserymen, and seedsmen of the United States and Canada, designating the special branch of the trade each one is engaged in. Price \$2.

were quite noticeable. They were planted during the last week of October and first week of November. In preparing the beds for planting the earth to the depth of 6 inches was taken out completely and laid to one side, rotted manure was then introduced and forked into the bed whose surface was then smoothed and the design marked out. The bulbs were then set out with the utmost regularity, all sitting upright and in place on the top of the ground, and when the whole bed had been planted the earth that had been removed was returned, gently at first so as not to disturb the bulbs, and all was evened off and left till spring. No covering as of salt hay, thatch, littery manure, branches or anything else of the kind had been used over the beds during winter. This same design, or a modification of it, will be used in the case of the bedding plants that are to be set out in these beds after the tulips are past.

TREES AND SHRUBS.—Considerable thinning has recently been done and with much benefit to the good looks of the park and the welfare of the remaining trees. Many Austrian and Scotch pines, Norway and hemlock spruces still remain in wretchedness. None of these trees when old thrive with us at Glen Cove any more than they do in Central Park, in fact when they get to be 25 or 30 years old decrepitude always overtakes them. And then again I know of instances around New York where both these spruces have become handsome large trees. The deciduous trees were just bursting their leaf buds and very few of the showy flowering ones were yet in bloom. The double-flowering Chinese cherry was at its best; the black thorn (*Prunus spinosa*) was white as snow, and the shad bush (*Amelanchier*) was also a cloud of white. Most of the early magnolias were shedding their petals, but *M. Lennei* was yet very beautiful, it is the largest and finest of the purple tinged varieties. Among shrubs *mahonias* were full of bunches of yellow racemes, Thunberg's spiraea displayed its snowy spray, *Lonicera fragrantissima* was still in bloom and leafing out, *forssythias* were gay but past their best, the shrub yellow-rub (*Zanthorhiza*) was draped in brown fringe, and Thunberg's barberry was full of bloom. This little shrub (*Berberis Thunbergii*) is attracting much attention on account of its neat habit, early leafing and flowering, finely colored autumn foliage, keeping its leaves late in the fall and its crimson-scarlet fruit not only all winter long but also till the following May, when the plants are rendered unique, bearing as they do leaves, flowers and ripe fruit all at the same time. It is also esteemed for ornamental hedges. *Rubus odoratus* is being largely planted in slightly shaded places, among trees, because it thrives well in such a place and blooms most all summer.

VINES.—My attention was directed to broad spreads of Hall's honeysuckle covering banks, knolls or rocky shoulders; it is pruned back almost close to the ground every second or third year, for two reasons, namely to keep it in well-compacted neat form and afford an opportunity to have it freed from weeds, sticks and other objectionable matter. Against the buildings *Ampelopsis tricuspidata* is being used to displace the Virginia creeper; when grafted on the Virginian creeper it is found to grow more vigorously than when grown on its own roots. The *A. Roylei* has been tried but found to be barely hardy enough. Among true ivies (*Hedera*), *Regneriana*, which is one of the largest leaved and hardiest of all, has

made rapid progress covering the shady face of some high rocky ledges with a pleasant wrap of green foliage.

THREE BAD WEEDS.—*Polygonum cuspidatum*, *Ægopodium Podagraria* and *Tussilago Farfara* are regarded as three of the most pernicious pests ever introduced into the park; when once established they spread with much rapidity and are hardly eradicable. At the same time the *polygonum* has much merit as a decorative plant, and the variegated leaved bishopweed (*Ægopodium*) although it spreads about as persistently as does the green-leaved one is often catalogued and grown as a hardy ornamental perennial.

BEDDING PLANTS.—Although many thousands of these are used in summer, the variety is limited and confined to a

DIAGRAM OF TULIP BED, CENTRAL PARK,
NEW YORK.

few thoroughly reliable sorts. *Geraniums* include some white and yellow-variegated leaved sorts, *Black Hawk* as a bronze and the double *General Grant* as a scarlet. Among *coluses* *Verschaffeltii* as a crimson and *J. Goode* as a yellow are the favorites; and the dwarf yellow *versicolor*, *amena* and *paronychioides* major among *alternantheras*. Among variegated leaved plants *Ficus Parcellii* is going to be tried this summer. And 175 plants of *Musa ensata* now in 12-inch pots and the result of 500 seeds sown last year are getting ready for summer work. The dwarf *canas* are much esteemed, and a stretch of hotbed frames is filled with them. A lot of *Papyrus antiquorum* in pots is also being got ready for planting out. When planted out in summer in deeply worked rich ground and liberally watered the paper reed grows very luxuriantly, but some difficulty is had in keeping it over winter. Outdoor plants had been brought in in the fall and cut up for propagating but a good many failed. When I used to grow these *papyrus* I never planted out my stock plants, but kept them in pots all the time.

ACALYPHA.—*Acalyphas* are used in thousands for summer bedding. Their vigorous, bushy habit and bold brilliant foliage render them more striking than any *coluses* or other soft wooded plant, and if well fed they revel in the warmest and sunniest parts of the garden. Many of the florists who attended the convention of the S. A. F. in New York two years ago will remember the massive foliage of the *acalypas* that were planted out in the beds in the city squares, and wondered what species it was. That very large leaved one was *A. macrophylla*; this, also *A. Wilkesiana* (tricolor) and *A.*

musaica are also largely used in Central Park. The first time I saw these handsome plants used to good advantage for summer bedding was in 1876, with Mr. Smith at the U. S. Botanic Gardens, Washington.

AQUATICS.—One span-roofed greenhouse 100 feet long by 11 feet wide and with side benches and a pathway along the middle was entirely devoted to the housing and propagating of aquatic plants for outdoor summer decoration. On the benches are arranged a series of water tanks which are made of plank lined with lead or zinc, but the lead lining is much preferred.

The plants consist of *nymphaeas* and *nelumbiums* of most all procurable kinds, *apogoneton*, *limncharis* and *cichhornia*. The *nymphaeas* had been planted in shallow wooden tubs or boxes or pots, and these sunk into the water tanks to whatever depth thought desirable. The *apogoneton* was grown in the same way but kept pretty near the surface of the water, not so much for the sake of the old plants as for the multitude of young seedlings of it that is being raised. Both the *limncharis* and *cichhornia* occupy a tank each, swim on the surface and fill their quarters packed tight. For summer use they will merely be lifted out of these tanks and cast into the outside lakes to spread and bloom at will.

At planting out time the *nymphaeas* and *nelumbiums* are brought hence to the ponds where all is in readiness to receive them, and instead of being turned out of their tubs or boxes, they are set in place in the holes prepared for them, the sides of the boxes knocked off and the hoops of the tubs cut and the staves removed, and the holes about the plants are filled in with earth. This prevents any disturbance of the root such as would be likely to occur were they turned out of their tubs as we turn a plant out of a pot.

The hardy species that are meant to remain permanently in the ponds are planted out into the soil in the ponds, but the tender species are not; they are planted into large plank boxes 5 or 6 feet square by 16 or 18 inches deep and filled with loam and these are lowered into the water. By this means the plants are under complete control in summer, and the roots are in warmer ground than they would be were they planted in the soil in the bottom of the pond, and they are easily gotten out in the fall. A derrick is used to lift the boxes in and out.

At the end of the summer when they are removed from the pond, one side of a box is knocked off and a careful man removes the soil and saves the plants and roots as intact as possible, and retubs or boxes them into the small sizes and places these in the greenhouse tank.

In the case of some *nelumbiums* and hardy *nymphaeas* that are also removed in fall in this way, deeper tubs are used and they are left outside in a warm place till cold weather sets in when they are emptied of water, and all set up close together, and thatch and tree leaves are piled over and about them enough to exclude frost, and boarding laid over them to keep them dry from rain and snow. When the winter is past the covering is removed and the tubs placed in a sheltered, sunny place and filled up with water again.

The workmen were busy cleaning out a pond for hardy water lilies, they were removing some inches deep of the surface mud. This was to be replaced by as much in depth of fresh fibrous loam and

HYDRANGEA THOMAS HOGG.

rotted in anure for the lilies to grow in. An inch or two of clean gravel over it would do away with any tendency to render the water muddy.

New York Notes and Comments.

Julius Roehrs has a flourishing house of his new rose, as yet unnamed. It will be remembered that this rose made its appearance in a lot of Anna Alexieff; it was at first regarded as a sport from this, but the marked difference between the two makes this extremely uncertain. Whatever its origin the nameless rose is a fine one—in color rather similar to Alexieff, it is larger, firmer and more double, with the advantage of a delicious fragrance. It shows a tendency to throw up single strong large shoots, instead of a number of smaller ones, like Alexieff, and possesses strong handsome foliage. It is a very early forer. Mr. Roehrs is not at all decided as to a name for this rose, though every one who sees it is ready to offer a suggestion. One of the names offered, which has the advantage of being short, popular and suggestive, is Mascotte—how does that sound for a rose?

Mr. Roehrs is putting steam heat throughout his place, and is also putting up some additional glass both for roses and palms. He does not grow small roses at all; hybrids are his specialty and he sticks to them, with the addition of palms and bulbs. His palms and other foliage plants are noticeably flourishing, among them a nice lot of *Dracena fragrans*, which is well liked among the trade for color, habit and durability.

Dracena Lindenii should be of decorative value; it is a very handsome plant, but a little tender. The popularity of a decorative plant must always depend quite as much on its ability to stand rough usage as on its beauty.

A good grower who has tried plunging the pots of his palms in tan bark says he is disappointed as far as its heating qualities are concerned. It does not appear to heat one particle, if anything, it tends to keep the pots cool. There appears to be a decided difference between the tan bark here and in Europe; there is a good deal of hemlock in it for one thing, instead of its consisting almost entirely of oak; it is ground up very fine, and seems to have been treated differently for the tanning. Abroad, nurserymen use it a good deal for plunging, as it heats quite quickly.

Palms and the like will not be kept in the houses much longer where there are facilities for placing them outside; as soon as the danger of frost is over a great many growers stand them out where they will have partial shade, either under trees or in a lattice shed, such as is used for azaleas and rhododendrons. This outdoor treatment has a very beneficial effect in hardening the foliage, as well as avoiding risk of burning.

A great many of the hydrangeas which came in since Easter have been sold in the form of cut flowers at \$5 a 100; they are much used where a showy effect is desired, to be viewed at a distance.

Trade is not bad considering the time of year, and it is likely to be brisk around

Decoration Day. Local trade around the city in bedding plants of all kinds is really good. In suburban places one can readily notice an increased taste for ornamental trees and shrubs; people take more interest in this class of stuff and seem inclined to plant things permanently decorative, in addition to more perishable bedding plants.

Mr. S. Henshaw is now at Thompson, Conn., superintending the arrangement of a large country place, the property of J. W. Doane, Esq.

Judging from the fact that chrysanthemums are now to be seen in considerable quantities at places where formerly they were not grown at all, it would appear that they now form a staple for the cut flower trade. Of course such growers do not go in for a great many varieties, they confine themselves to sorts which have proved their value in the flower market. Retailers would be as much at a loss now to be without chrysanthemums in autumn as to be without roses in winter.

The subscription started by the Florist's Club for the purpose of holding a flower show has been responded to so liberally that there is little doubt of its ultimate success; such a show would materially add to the usefulness of the club.

Our National Society.

FUTURE BENEFITS TO BE DERIVED.

It may seem to many that this subject has been discussed enough; that there has been, there is, and will continue to be, a benefit in the society for all its members, and that the steadily growing strength of the society is proof that the fact is generally admitted. But there is one idea in connection with this subject which I have not yet heard spoken of by any of our members, although it has doubtless been in the minds of many. It is this: The growth of the society will engender economy to the craft. This may be explained in many ways, but I will mention only the one I consider the principal. We are to increase our future profits more by lessening our present expenses than in any other way. There is no doubt I hope in the minds of any of us that both flowers and plants can be produced cheaper on a large scale than on a small one; not only cheaper but better, and with less individual care, worry or labor. A man starting a greenhouse business on a small scale is under many disadvantages; on a small place only large enough to support himself he tries to do the labor, watch the fires day and night, study the requirements of his stock, also his customers, keep his accounts, do his own collecting, propagating, delivering, etc.; in fact he has so many irons in the fire he is sure to let some burn, hence a loss; if he manages to save enough to enlarge he gets help, his first help should be common labor, this gives his body a rest and strengthens his mind, he can think and calculate better. When he becomes able he employs another hand; let this be some one to deliver, run errands, etc., then he can spend almost the whole of his own time right where his capital is invested, and watch it with more care, produce better stock; then he

will notice an increased demand for his produce, and so on as fast as he increases his business, employ help, and has each employ take a certain branch or department as his specialty; he must always retain the highest priced branches of labor for himself until the last. Never hire a man at \$3 a day and work yourself at labor which you can employ at \$1, that would be a loss of \$2 a day to you.

After this man has successfully built up a large business, if he is wide awake he will discover that he has been traveling up a mountain, that the further he goes the less the road has been traveled before and consequently the more danger in letting his vehicle stop. It is sure to roll back down the hill if he does, and although he may have shown strength in climbing where he is, the crash will be greater in proportion to the height attained if he roll back. Here is where the S. A. F. takes hold of us. We are all climbing the same mountain, at first we are too apt to look at the mountain and say it is narrow up there and there is not room for many of us up there, but we have learned that the mountain peak is only as a finger pointing to perfection as we climb. Although we continue to get higher we do not become crowded for the mountain continues to widen. Therefore we are gradually throwing our jealous instincts into the waste basket, and are helping each other climb. We have concluded that two heads are better than one, we have formed a caravan and will now travel together. If one of us strikes a snag President Jordan will at once send a detachment of the society's stump pullers and have it out. Don't you remember how Senator Wilson undertook to plant a postal snag in our way? It was not long after Secretary Hill sounded the alarm that we not only had the snag out, but made the road double the width at the same time. It would be difficult to estimate the saving in expense which was caused by this road improvement. This is only a fore runner of what is coming, we are becoming more and more as one corporation. I think we shall continue to interweave our interests with one another without scarcely realizing it until we really find ourselves consolidated.

Since we established a medium of exchange of ideas and reports of discoveries etc., which has saved many a partial if not complete wreck (the *Am. Florist*), who can be "penny wise and pound foolish" enough not to support that? Who can deny that the craft has profited on account of its existence? Next the hail insurance; this will undoubtedly soon be self-supporting, I mean by that it will soon have capital enough invested to pay all losses without assessment on its members. This is surely economy which must be credited to the S. A. F. Then there is the Protective Association for the saving of bad debts; it is not yet complete, but soon will be. I am sorry to admit there are dishonest drones among us, but it's a fact, and will it not be economy to compel them to pay for what they get? No one individual can cause this to be done, it is the work of the S. A. F.

There is one loss which I think should be the next to attract our attention; it is a large one, and can only be saved by the co-operation of all. It is the loss of cut flowers. There are many complaints nowadays of commission men made by the growers. Of course dissatisfaction comes in where flowers are thrown out. I notice some complaints that quotations are good but the returns are not according. I frequently get telegrams from

commission men from different places offering roses, carnations, etc. for the ensuing two or three days at reduced prices, or something like this: When roses are quoted at 10 cents they telegraph "can you take five hundred roses to-day at 5 cents?" In such a case I know the party has had consignments too large for the demand and is anxious to dispose of them on the quiet without breaking the price. If the grower himself was standing by he would sanction the action, but not knowing all the circumstances he will complain to find his roses went at 5 cents when quotations were 10 cents. Now what is the commission man to do when the stock piles up and no orders come in to take them? This may represent the state of affairs in Chicago and in St. Louis. They are very short of flowers, one city may lose flowers the same day another is short, but through each city not knowing the state of affairs in the other city, there comes a loss which might be saved to the mutual benefit of both. Frequently they do learn these facts, then A ships to B and C ships to D, etc.; sometimes fifty separate packages will be sent from one city to another ordered by as many telegrams when one shipment and one telegram might do all the business if proper arrangements were to be made. Can not we induce our commission houses to connect themselves in such a way as to establish a clearing house in each city and have each of these clearing houses connected by wire or special telegraph arrangements, so that market reports may be exchanged constantly, and drafts may be made from one to another on such surplus that may exist in one place and wanted in another? Something after the manner in which our banks handle their money. I think an immense saving could be made in, first, flowers themselves; second, telegraph expense; third, express charges. These three savings would be largely for the benefit of grower and commission man, but the retailer would be helped by being able to procure what he wanted easier and with less trouble and annoyance. Such an arrangement would perhaps necessitate the quotation of prices more frequently than now, but they could be put on the bulletin boards, there would be no temptation on the part of any individual to cut prices, and growers could always ascertain from the records of the clearing house just what stock was selling at each day in the year. This would in reality be establishing one immense flower market for the whole country; we would all grow for the one market and all purchase of the same market. Our market would be larger, our expenses smaller than now. Why not go at it at once? C. B. WHITNALL.

Gloxinias.

BY WM. FALCONER.

Between the end of March and the first of October I can get all the gloxinia flowers I want with very little trouble, but I must confess to ill luck between November and February. Gloxinias, however, are indispensable to me both as cut flowers and pot plants in bloom, and, happily, they are very easily grown in spring and summer and taken care of in winter.

There are two types of gloxinias, namely, drooping flowered, which is the original form and erect flowered which is a type obtained by cultivation. Both have their merits, especially in the case of pot plants, but my own choice is the erect flowered. It affords us a larger variety of color than do the drooping blossoms, and the flowers are larger,

more showy and display their brilliance to better advantage.

A stock of gloxinias can be gotten up in two ways, namely, from seeds and from cuttings of the leaves, and particularly in European collections, the finer varieties are named and perpetuated and catalogued as we do geraniums or roses. Some years ago we imported a lot of named sorts, paying \$1.25 per tuber, besides expenses, but we gained nothing as we get from seed varieties just as pure, brilliant, large and pleasing.

Although gloxinia seeds are very small and the seed packets are very thin, the seed has great vitality and most every one will grow. Now don't be too economical and buy cheap seed, but get the very best strain of seed that money can procure, then after you have gotten a good start you can save your own seed from your own finest flowers. Every batch of seedlings, however, is likely to contain some poor flowers, so that we should always be prepared to thin out and cast away inferior stock.

Seed sown in January in a warm greenhouse should, under favorable circumstances, afford us flowering plants in June; seed sown in February should give flowering plants for June or July, and seed sown as late as April should give flowering plants for August. How long the plants may continue in bloom depends upon circumstances, but generally they keep in flower for several weeks. And I find that late sown seedlings are much more to be depended upon for late flowers than are old tubers that had been started late, for it is a difficult matter to keep old tubers dormant and in a healthy state after May.

Nowadays we want four kinds, in color, of gloxinias, namely, the brilliant, velvety, crimson-scarlet, or scarlet and white; the intense velvety violet-purple, or purple and white; pure white, and the lovely spotted varieties. Of recent years these spotted flowers have become quite prominent, and they are exquisitely beautiful, just as easily raised from seed as are the self-colored ones.

Gloxinias for winter and spring blooming should be grown in pots in a warm greenhouse, near the glass but shaded from sunshine. Handsome plants with foliage bent over and completely hiding the pots may be had by growing the plants suspended from the roof in the same way as orchids are hung up; and when there is a demand for plants in bloom in summer they also should be grown in pots. And I find that plants in pots bear seeds more abundantly than do those that are planted out.

When cut flowers only in summer are wanted by far the easiest way to treat gloxinias is to plant them out in cold frames as one would pansies or lettuces, but they have got to be shaded at all times from sunshine. This is also the best way to get up a stock of fine, large tubers; one year old planted out tubers are usually as large as two year old pot grown ones. When the plants begin to die down in fall they should be cut over, and the tubers lifted and stored close together and one kept in flats filled with earth or sand and kept moderately dry, and after a few weeks perfectly dry. Gloxinia tubers should not be kept in a cool place in winter, from 50° to 55° is a safe temperature, but less than that is risky.

Cut Flower Quotations.

Perhaps if "A Grower" (page 334) were also a buyer he would not find your cut flower quotations amiss. There are

GROUP OF GLOXINIAS. TWO-THIRDS NATURAL SIZE.

several ways of accounting for the discrepancy between the prices quoted and those received by the growers. first the prices quoted are always for selected blooms in the pink of condition, and no

grower can send his commission man any quantity of *only* first-class flowers. Then the buyers frequently offer so much for a box of assorted roses or other flowers and the commission man does not feel

justified in refusing a fair offer. Then again there is always some waste. And lastly the large growers generally crowd their smaller brethren to the wall, be the commission man ever so impartial. A

New York florist orders Taylor's Cusins, or a Philadelphia florist, Dennison's Bennetts, and can Mr. Allen or Mr. Pennock refuse to recognize a grower who has made their reputations? The small grower may have just as good Cusins or Bennetts but the others are called for and his must await another customer. When all these facts are taken into consideration it does not appear strange that prices realized are much lower than those quoted. So before condemning the FLORIST for putting Romans at \$4 to \$6 when we are only getting \$3, let us buy some and see what price we are asked.

Mrs. Alpheus Hardy.

THE "OSTRICH PLUME" CHRYSANTHEMUM.

To the old question of—What is in a name?—a superficial answer would assuredly be in the negative. But this question has a deeper meaning than is apparent on the surface.

We all know that a name does not change the character of anything. It retains its essential characteristics no matter what the name. Yet a name, to be true to its purpose should betoken the thing named.

If this principle was always applied in the naming of plants we should, as horticulturists, be considerably the gainers. And it is to be regretted that raisers of new varieties should nearly all ignore this principle. Who cares whether some man's name should be perpetuated by bestowing it as the name of some desirable plant? No one cares but the man whose name is used. But every interested person cares when the new variety is named according to its characteristics, or by a name that is in itself attractive.

That there is something in a name is completely proven by the care that is given in the naming of new books. Not the least part of the author's study is given to the question of what name his creation shall bear. And so it should be in the naming of plants. For a good and striking name helps to sell the plant as well as the book.

How much more attractive and desirable is the name the "Bride" than the name "Cornelia Cook," "Meteor" than "Wm. Francis Bennett," "Perle" than "Catherine Mermet," "Moonlight" than "Robt. Bottomly."

It is in recognition of this principle that the name "Ostrich Plume" has been

appended to the chrysanthemum originally called "Mrs. Alpheus Hardy." No observant man but will acknowledge that the attractive title thus given to this chrysanthemum does materially increase its sale. Naturally it will be so. Hundreds that are not florists will have their attention attracted by such a designation when its original name of Mrs. Alpheus Hardy would mean nothing at all.

It is not apparent why florists should be censured for using any legitimate means for increasing their business. All sorts of schemes are used by advertisers to attract notice, and this case in question is but one of them. Neither can it be classed as an advertisement with the intent to deceive. No florist but knows the original name, and therefore it is not likely that he will be misled. And if the amateurs only notice the name in larger type and place no importance to the other one that is in smaller type, what harm is done? There is no purpose to send out as a new chrysanthemum one already in commerce, neither can it be said that there is mischievous misrepresentation. It is, however, an encouraging feature of the future of our business, that such searching criticism is met with on every side, causing every honorable florist to value his reputation more than his profit.

ALFRED E. WHITTLE.

MR. EDITOR.—I have just read a reply by Mr. Alfred Henderson to Mr. May, that is to say an article attacking Mr. May's common sense, his ability to judge and act fairly, his knowledge of the "art" of advertising successfully, etc. He expresses his surprise at Mr. May's criticism. Surely there has been enough said on the various subjects which are included in the business of the committee on nomenclature to convince any one that such practices as the Ostrich Plume advertisement would not be let slip unnoticed. I think that Mr. May's article shows that he *knows too much* about our business to advertise in that way. I suppose likely that putting the name Mrs. A. Hardy in small type on the same page makes P. H. & Co. legally safe, but if their safety is in proportion to the size of type, they are not very safe. Let any person who is not posted in our business be shown page 115 of their catalogue and ask them what is advertised there, I am sure they would say, it's a new chrysanthemum, the White Ostrich Plume. Now Mr. Henderson says they have not re-named the plant. Then what does their engraving mean that says in large letters the Ostrich Plume Chrysanthemum? If that is not adding another name to a plant then what right have they to send a person Mrs. A. Hardy who orders the Ostrich Plume? That would be substitution, and I would like to know whether or not they take the trouble to write each such customer that they have no such variety in stock and send Mrs. A. Hardy, the flower of which resembles an Ostrich Plume.

Mr. H. refers us to page 2 of cover to show us that he has called another variety the Pink Ostrich Plume. That only makes a bad matter worse. Now read the first line of this adv. "We have received from Japan a few plants (the entire stock) of a gorgeous pink variety of the White Ostrich Plume Chrysanthemum." Now what does that mean if there is no variety by that name? Does it not give the reader to understand that there is a plant by that name? And why? Simply because it will create the impression that they have a wonderful variety

which no one else has. They were not satisfied with the use of the name Mrs. A. Hardy because every florist in the land is advertising the same thing. Now let us go back to page 115, try this experiment, lay a strip of paper over the words "The Ostrich Plume Chrysanthemum" (because Mr. H. claims that does not denote the name of any plant). Then what have we left? Just two items of interest, viz: a cut with name Mrs. A. Hardy without any descriptive matter or comment whatever, nothing to say it is large or small, black or white. On the other side we have a something—who could tell what? What professor of the English language could ever tell the description had any reference to the cut on the same page, unless he is allowed to believe that the name of the plant so illustrated is "The Ostrich Plume." Do they say that the flowers of Mrs. Hardy resemble an ostrich plume? If they do I can not find the place. But now try another experiment, cover up the words Mrs. Alpheus Hardy and you have complete sense; the cut, description and all fit snug.

If Mr. H. really thinks the flower of Mrs. A. Hardy looks like an ostrich plume or a poodle dog's tail he has a perfect right to say so, but he does not use the term in any such manner. Hundreds will answer such an advertisement ordering one or more plants, who either have Mrs. A. Hardy already in their own collection, or could and would have purchased it of their local florist, not supposing that they were putting the money into the hands of a wonderfully proficient advertiser and depriving their honest neighbor of just so much trade.

And now, Mr. Editor, you must have considered "The Ostrich Plume" to have been given as a name, for you say we can hardly object to catchy, popular names when the correct name is also given. The only popular name it ever had was Mrs. A. Hardy; it had no other name either popular or unpopular. When they advertised The Ostrich Plume they offered a plant which had no existence, there was no such plant. Mrs. A. Hardy was not known popularly by any other name, they simply used the name as a catch and filled their orders with a plant we all have. I hold that a man has no more right to attach a false name to a plant in order to raise money on it than he has to attach a false name to a check. Nothing that will lead to deception is just or honest, even though it be done by a person able to teach Mr. May how to advertise.

You say, Mr. Editor, there is hardly any necessity for ventilation. I consider that the hole left in that adv. through which to creep is so small that a good strong ventilator is necessary, such a one as Mr. May advocates in his model greenhouse, one that opens from the ridge. It is the only apparatus which will prevent blight from injuring the florist business. And our nomenclature committee I trust are drawing plans for it now.

C. B. WHITNALL.

Sulphur as a Fungicide.

BY S. B. GREEN.

[Read before the Society of Minnesota Florists.]

Fungi are divided into two classes. All the members of one group live on dead or decaying organic matter and are called saprophytes. Familiar examples of this class are our common toad-stools or mushrooms, the slime molds, yeast plant, and the plant which produces dry rot in timber. The other section consists of fungi

that live on living organized tissue, and are consequently called parasites. Familiar examples of these plants may be found in the rusts which destroy wheat and other grains; the rot of grapes, apples, potatoes, etc.; mildew on grapes, lettuce and roses; blight on strawberries, onions, apple, pear and plum trees, cherries, etc.

The diseases common to animals come also in this class, and we find that cholera, consumption, typhoid fever, and many other diseases are clearly due to the growth of some minute fungus in the tissues of the organic matter, the growing of which in the tissues, together with nature's attempt to apply relief, causes the symptoms we term disease. The life history of most of these low organisms is very complex, and on this account and their minute size they are very difficult to study.

Among American farmers and gardeners it is only quite recently that intelligent thought and inquiry regarding these important sources of loss has been awakened. It is difficult to give an idea of an organism which is so small as to be scarcely discernable, except by a microscope of very high power, and yet one which has such great power for mischief.

CHARACTERISTICS OF FUNGI.

A fungus is as truly a plant as the rose bush or grape vine on which it grows. It is, however, of much simpler structure; but it is sufficiently complex to adapt it most completely to the offices it has to perform. A rose bush, or corn plant, has flowers, leaves, roots and other distinct organs which fulfill a distinct and special purpose in building up the plant, while a fungus consists of simple minute threads which spread throughout the substance on which it grows. These threads are called mycelium, and form the fungus plant itself. The mycelium spreads through the plant tissues on which it grows, and at different periods it ripens a crop of spores. These spores are analogous to seeds and fulfill the same office. For an example let us consider the common puff-ball mushroom (*Lycoperdon germatum*). The plant itself is in the soil, and appears like a mesh of fine white threads. It may grow there for several years without fruiting if conditions are not favorable. The edible portion is only the fruit and its receptacle, and is the mushroom. When ripe the puff-ball is found to be full of dust, each particle of which is a spore. A single puff-ball will contain many millions of spores, so light as to be carried on the gentlest breeze, yet each one is capable, when brought into favorable conditions, of reproducing itself many million times.

To a great extent, what is true of the puff-ball fungi, which are large and tangible, is also true of their minuter brethren which produce the mildews and blights, although these latter can only be studied by lenses of high power.

Fungi do not need leaves because, like dodder and other flowering parasites, they live on the food which is digested by the plants in which they grow. The plants on which fungi live are called host plants.

The mycelium, of most species of fungi, penetrates so deeply and is so thoroughly protected in the tissues of the host plant when once established that it cannot well be got at. On this account the best remedies for fungus growths are those of a preventive nature. That is, the spores must be destroyed before maturity; or else before they have penetrated the tissues and are beyond the reach of fungicides. There are some exceptions to this rule, and mildews, such as those of roses,

grapes, etc., which grow near the surface or in the bark, may be easily destroyed at any period of their growth.

Fungus diseases develop most rapidly on sickly plants, in a warm, moist atmosphere. Yet under favorable atmospheric conditions any plant may become diseased although in apparent vigorous health when attacked. It is therefore important to have at all times, if possible, some fungicide present in the air to destroy any germs which may find lodgement on the tender foliage. This is especially necessary in greenhouses, where, from the favoring state of the atmosphere, these growths are very abundant. A good fungicide for greenhouses must have the property of destroying these spores, while at the same time it must be harmless when in contact with the tender plant tissue.

THE APPLICATION OF SULPHUR.

It is well known by all greenhouse men that sulphur when put on steam or hot

SIFTING SOIL.

water pipes is vaporized, and is beneficial in preventing mildew, and it is a common practice to paint steam and hot water pipes with linseed oil and sulphur. But this can only be successfully done when the pipes are very hot, and such is not the case with greenhouse pipes in warm weather.

I wish to call your attention to a method of using sulphur, which while not new, is nevertheless not well known. I refer to the practice which is now being largely adopted in the Eastern States, of vaporizing sulphur over the flame of a stove. It is not well known that when sulphur is burned so that its fumes come in contact with tender plant tissues it destroys them. On this account it has been found dangerous to burn sulphur with tobacco stems in smoking greenhouses, as Nanz & Neuner at one time did in their houses.

Sulphur melts at a heat a little above that of boiling water (at 259° F.), and it takes fire at 500° F. It has been found, in experiments on a large scale, that if sulphur is slowly boiled at a temperature of from 250° to 400°, the sulphur itself is evaporated without burning, and the vapor from this boiling sulphur is one of the best fungicides known. It acts the same as if it were put on hot steam pipes, only with greater power. The common method of using it is to put on a kerosene stove a small iron kettle containing about two inches of sulphur, which is carefully melted and evaporated. In using this method of destroying mildew, etc., great care must be exercised to prevent the flame from being too hot, or the sulphur will take fire. I have known of several accidents occurring when the lamp was lighted and the wick turned too high; but by setting the sulphur kettle in a dish containing sand over the flame, the dan-

ger is almost entirely removed. But while I know there is a chance of accidents happening, yet its advantages are such that if ordinary care is used they are reduced to a minimum. I have known of rose mildew and rose leaf blight being successfully treated by means of this plan of using sulphur.

Mr. W. Wood, of West Newton, Mass., a short time ago told me his experience in using sulphur in his greenhouses for a remedy for red spider. He is a man who yearly takes a large number of prizes at the shows of the State Horticultural Society. He has written out his experience as follows: "In 1884 the red spider appeared on two of my eighteen vines the first week in August and so injured the foliage that the fruit ripened imperfectly. The following year the spiders appeared on all the vines the last of July. The foliage commenced turning brown and their webs covered the under side of the leaves. I procured some flowers of sulphur, and using an ordinary sauce dish of glazed granite ware, put in the sulphur to the depth of one and a half to two inches, placed it over the blaze of an oil stove and boiled the sulphur three and a half hours, filling the room with the vapor. The next morning, by the most careful examination with a microscope, I could not find a live spider in the house. From that time on the new foliage was as clean and bright as in the early part of the season, and the fruit ripened perfectly. I have found evaporated sulphur effectual in destroying mildew which occasionally appears in most cold greenhouses."

Mr. Wood also finds this remedy effectual in preventing the fungus that causes the dropping of the leaves of chrysanthemums after they have been potted in the fall.

BURNING SULPHUR.

Burning sulphur is much more effectual than evaporated sulphur in destroying fungus, and while it can be used in safety is much to be preferred. After careful and repeated trials on a large scale I am confident that there is no danger of injury to dormant deciduous plants from burning sulphur. I think that it may almost be used without limit. I have repeatedly burned as much as a large teaspoonful of sulphur by putting it on a red hot brick, in a cellar only 10x12x6 feet in size, and this amount when burned would so fill the space that man could not breathe in it, yet roses, plums, apples, elm and many other dormant plants stored therein were uninjured. In fact, I have used it so often successfully that I should hardly feel sure of carrying roses through the winter in my cellar without it, and not have some injury from fungus. I have also found it a good practice to burn sulphur in vegetable cellars.

Sifting Soil.

The accompanying sketch shows a handy device for sifting soil for potting, which, while not new, is probably not as widely known and appreciated as it should be. It can be put together by any one handy with saw and hammer. The sieve slides on hardwood strips fitted just below the inner edge of the box. The bottom of the sieve is of wire cloth having a mesh of 1/4 or 1/2-inch as preferred, strengthened by an iron rod running lengthwise through the center. It is well to have several sieves of different meshes when differing degrees of fineness in the soil is required. The board extending along the side of the box at the bottom is moveable and the sifted soil is taken out through the opening made by its removal.

It may not be generally known that some shading, now the hot sunny days are here, will be of advantage to the roses Mme. de Watteville and Mme. Cusin.

The shading, however, must be of a light character. A mixture of naphtha and white lead, sprinkled over the glass by a syringe will be found of easy application and of the right nature to prevent scorching without obstructing light. Care must be taken to have this shading thinly applied. A calm day selected and a careful man to use the syringe. If the application is found to be too thin it is easy to apply the second time. Far easier than to rub off an excess. Commence with the least possible shade first and let experience decide as to the necessity of increase.

Difference in construction and location of greenhouses determines in a great measure this question of shade. How much, or none at all. With the modern style of rose house, having large glass, no rafters and a full southern aspect, a little shading will usually be found of benefit, especially for the roses above mentioned. This has been satisfactorily demonstrated within the past April. As soon as the bright days came after Easter the Wattevilles began at once to deteriorate in size, but with a little shade on the glass the size is again as formerly. The rose upon the center benches do not require this protection as soon as those upon the front benches do.

It is worthy of notice that all those roses whose size lessens as warm weather advances require cool temperature to have the flowers in perfection. And these are the roses that in fact do the best with a few degrees less heat in winter nights than those others which are not so affected by intense sunshine and heat. It will be found that the fact here stated can be used as an accurate guide in determining the character of our rose houses for next winter. If we are obliged, in some instances, to plant two kinds in one house let us select those of like requirement as to temperature. There is a marked difference in the habits of roses in this respect. It is not advised, however, that there should be much difference if any, in the temperatures that our rose houses are kept at with sun heat in winter.

There are no roses that are likely to prove of more value to those florists who need plants to flower outside during the summer months than the old varieties *Malmaison* and *Duchess de Brabant*. Good plants of these from 4-inch pots planted outside in May will astonish many by the profusion and quality of the flowers that they will produce. Attend to them and they will repay the labor and care expended upon them. *Duchess de Brabant* is of particular value as a plant for spring sales in pots. There is no rose that can surpass it in this respect, very few that can equal it.

ALFRED E. WHITTLE.

A Contrast.

The accompanying sketch shows the

exact size of two *Mermet* buds received among others on consignment by a Chicago dealer. The largest one is merely a good average bud. The smallest one—well, we would have found it difficult to believe that any grower could have had the conscience to send in such a thing to sell had we not seen it with our own eyes, but there it was and a lot more like it, some being nubbins even smaller than the one shown, and every one counted and included in the memorandum sent with them by the grower.

Could there be any better evidence of the absolute necessity for some sort of a classification of roses and other cut flowers as to quality?

Marketing Cut Flowers.

BY JAS. D. RAYNOLDS.

[Read before the Chicago Florists' Club.]

Gentlemen of the Chicago Florist Club, the subject for debate this evening is, Whether the method of marketing cut flowers, etc. through commission dealers is or is not a satisfactory method. I assert that it is not, yet desire it to be understood that I am not here for the purpose of attacking the dealers, far from it. The dealers are my very good friends and so far as their system will permit have, I am convinced, done their very best to see to it that I have had just and full returns on all consignments. I have no possible quarrel with the commission dealers, but with the commission system I have a very serious quarrel and I now arraign this system and charge it with high crimes and misdemeanors, chief among which and overshadowing all others is that as at present conducted it is responsible for the *wasting* of just that proportion of our whole product that should go and that formerly did go to the making of a legitimate and living profit. In fact, what may be called the text of my sermon is *Waste*. Waste in one shape or another I believe to be the main cause of our troubles and if waste can be stopped the trouble will largely cease. Not only in our business, but in all others the margin between cost of production and obtainable price has been narrowing year by year until now the man who is not able to find a market for all or nearly all of his product is periously apt to find himself doing business at a loss.

Before endeavoring to show how the present system is responsible for this profit destroying waste it may be well for purposes of comparison to briefly review the past history of our business, to see what methods were formerly employed for marketing flowers and why these methods failed. In the olden time when the demand for all cut flowers in winter and for roses the year round was largely in excess of the supply, it mattered little what method was employed since sales were sure and waste an inappreciable item. Then the retailer was only too happy to make a contract directly with the grower for his entire season's clip, and prices, both retail and wholesale, being sufficiently high, both parties had cause to be well satisfied with the arrangement while it lasted. Then there was a good profit in growing cut flowers and inevitably and naturally competition was invited till very soon growers began to jostle each other and the retailers found their interest in dropping the contract system and buying from day to day wherever they could do the best. This brought in the peddling system and as there were many growers who could not possibly come into the city every day to market their own wares there ap-

peared almost simultaneously on the scene the "commission man" whose ostensible function it was to represent those growers who could not come in person and to market their product for them.

For a time it seemed that there was nothing to complain of; the grower had his option of two courses, each with its advantages and disadvantages. He might go into the city with his baskets and peddle his own stuff, using up valuable time it is true, but saving commissions and selling all of his stuff at such prices as he was able to make from day to day, or he could stay at home and attend to his legitimate business and pay a commission man to sell his flowers for him. So long as there were but one or two dealers the business was in a tolerably healthy condition. There was a constant demand from outside towns on telegraphic orders and the consignor could count with tolerable certainty on having most of his stuff sold if its quality was first class and receiving full list price therefor, less commissions. But production has been constantly increasing, fully keeping pace with the demand, and sometimes apparently even outstripping it and the number of dealers has also been on the increase until I believe it is universally admitted that fond as we are of the dealers and fond as they are of each other, yet the supply at the present time certainly exceeds the demand. It is possible to have too much of a good thing.

Now let us see how the commission system operates under existing conditions. John Doe, grower, sends his stock to Richard Roe, dealer, to be disposed of to the best advantage. He trusts him implicitly—he *has* to. He is obliged to rely on the honesty, the impartiality and the accuracy of not only the dealer but of every one of his employees. And right here let me say that I do not believe but that the dealers are honest and honestly *trying* to give every man his due, but the odds are against them; not only must they be honest above suspicion, but they must become personally responsible for the honesty of their employees. Still, granting as I do that intentional dishonesty is so rare that it need cut no figure in this discussion, yet the difficulties in the path of the dealer in his efforts to give satisfaction to both classes of his customers are becoming so great as to be to my mind well nigh insurmountable. The dealer is supposed to represent the grower, and as his agent to get the highest possible price for all consignments, it being the firm belief of every grower that his stock is A 1 in quality and entitled under all circumstances to the outside listed price. But the poor dealer has his own bread and butter to look after. He has the active competition of half a dozen other dealers as well as of the peddlers (who still hold the field) to contend with, and if he is to keep his trade he *must* meet the prices of these competitors, and in fact for his customers outside the city who order by mail or telegraph it is his plain duty to make the lowest prices possible. The result is a curious complication. It is to say the least rather a difficult situation for any man when his duty and his interest alike require him at the same time to sell at the very highest and the very lowest price.

We are told that the growers may feel assured the dealers will see to it that they get good returns for the sake of keeping their trade, since they cannot do business without consignments, and it is always open to the grower to go somewhere else if he is not satisfied. Well, is it open for

A CONTRAST.

him to go somewhere else, and if so where shall he go? In the first place his period of most intense dissatisfaction is apt to be *after* the holidays when he is by no means sure of being received with open arms and invited to partake of fatted calf by any other dealer than the one he has been shipping to, and more than that he has no reason to believe that any other dealer would be able to do better by him, since all are subject to the same conditions, and in fact it is evident to any careful thinker that it is not any individual dealer who is in fault, but the impossible system on which they are doing business. The active competition between the dealers and the fact that the retailers who buy of them can and do play them off, one against the other and go from one to the other every day to make their purchases, places the consignee at a constantly increasing disadvantage. This disadvantage under which the grower labors has not been recognized nearly as soon as it would but for the misleading and utterly fallacious theory that the commission dealer is a "middle man." People have grown so used to having him called a middle man that they have not stopped to question it and have assumed that as such his function was to preserve a careful balance and do exact justice between his two classes of customers, his sellers and his buyers. I tell you gentlemen he does not do this and he can not do it. He is *not* a middle man in this sense at all. If he were, the see-saw would teter much more satisfactorily, but unfortunately he is about a foot or a foot and a half over towards the retailers, end of the plank, not through intentional favoritism, but because he can't help it. And the reason for it is this: His place of business is in one sense a flower market, but it is a market for the buyer only and not for the seller; by which I mean that it is the retailers' market but not the growers' market. The retailer buys from the commission man. Does the grower sell to the commission man? *Well hardly.* The retailer goes in person to his market,

sees his goods before buying, buys only what he sees a sure sale for, leaving the surplus for the barrel, or if he does not like the style or prices, trots around the corner to another market where, (after extorting the high quality and low prices he was offered over at the other place, and after a sufficient amount of haggling) he secures his day's supply at an agreed price (which is *not* necessarily the list price) and the transaction is completed with no question left unsettled for future disagreement. The grower on the other hand does not go to market with his wares (except in the sense of merely carrying them there, which the express company can do as well). He does not sell his wares at all. He relinquishes all control over them, turns them over absolutely to the discretion of the dealer, trusting with a simple and childlike faith that they will be *sold* for him at the very highest price with the least possible waste and with no possibility of error in making returns. Does this beautiful faith receive its just reward? In another world perhaps it will. Whether it does in this one is a question that you can answer for yourselves. Far be it from me to assert that it does not. The dealers certainly try to stand as straight as possible, to lean neither one way nor the other, but you know it is possible sometimes to stand up so very straight that you will fall over backward, and as I have shown, the immediate conditions are such that the dealer has a very strong tendency to lean towards the buyer and to act virtually as his agent rather than as the grower's agent, which was his original and legitimate function.

There are too many clashing interests, pulling and hauling at the dealer's conscience now. His case is worse than that of a man sitting on a fence and trying to look both ways at once. He tries and tries to look out at the same time for the interests of the grower and of the buyer and of himself, and instead of sitting on a fence he reminds me of a man perched on the business end of a sharp stick trying to face three ways at once and to look

pleasant about it all the time. It can't be done. It is absurd to expect it of him and the sooner we abandon the idea and look out for some better system the better it will be for us.

It might be inferred from what has been thus far said that I believe the retailers to subsist on a diet exclusively of pie, while the growers have the plainest of bread without any butter. Well, perhaps I do believe that the handle of the jug is around on their side as it were, but even they I am told have their grievances, on which some one of them will doubtless when his time comes hold forth much more instructively than I could. But there is a matter to which I must allude, because it is charged with some reason that the growers are responsible for the trouble and could remedy it if they would. I refer to the annoying competition that the first class florists are subjected to by the fakirs, and by fakirs in this sense is meant not only the street vendors, but some apparently regular dealers who by mysterious underground methods seem able to buy and sell at times at prices way below the current quotations, and the conservative retailers are asking with natural indignation "Where, and how, and why do these people get their flowers at prices that enable them to undersell us?" I shall not undertake to answer where and how but I think I can tell you *why*. It is because the devouring element of *waste* is eating the heart out of the growers and they have been driven in self defense to trying to find some outlet for their surplus, some way to check this awful waste that has been increasing year by year until (if there is no back door trade) it now amounts, as I think any grower will testify, to from 25 to 40 per cent of his entire annual clip. While it is true that the wholesale price of cut flowers at holiday time is considerably higher than it was a few years ago, yet the price at most other times is noticeably lower so that the average price the year through has been steadily on the decrease, while the rates between wholesale and retail price remains about the same. Yet mark the difference in the relative situations of grower and retailer then and now. Then they contracted for our entire clip, and they took it and paid for it, and the loss at such rare times as there was a surplus came out of the retailer's profit. Now though prices still average the same he buys only what he absolutely needs, not one flower more, and the surplus is left in the hands of the dealer, to be dumped into the ash barrel unless otherwise disposed of. Can any one wonder that with a wastage of nearly one third his annual clip staring him in the face and a 15 per cent commission to be deducted from what the other two thirds sells for, he is tempted into making bargains with street fakirs or instructing his commission man (on the quiet) to sell at any price rather than have anything left to dump into the barrel. Is it any wonder either that he resorts to the pernicious practice of "soaking" or "salting" down for times of special demand in hope to realize then somewhat to compensate him for the enormous losses in times of over supply. He sees the dealers anxious to hold their trade, cutting each others throats and feels at the same time the same fierce grasp of competition clutching at his own throat. Can any one wonder that he is tempted to take a hand in the ruinous game and by his own ill-advised efforts to recoup himself only do still more to beat down prices, adding fuel to the flame that is consuming all his profits. Let it not be supposed for

one moment that I defend the practice (as at present carried on) of selling job lots at their own price to fakirs and others; it is a penny wise and pound foolish policy, but while human nature remains as it is it will be done and until some radical change is made in our methods of marketing it is useless to try to stop it.

It will be admitted that I have drawn a sufficiently gloomy picture of the situation, and yet I do not believe it is overdrawn. It is certain that there exists a very general and pronounced dissatisfaction with existing methods. The growers are grumbling over the increasing disparity between their shipments and their returns. The retailers are indignantly complaining of the competition of irresponsible fakirs and pirates, of the glaring inequality of prices and the consequent difficulty of maintaining paying rates, while the wholesale dealers in virtuous consciousness of unmerited abuse are about ready to give up life's fiftful fever and fly to a better land where the wicked cease from troubling and the weary are at rest. There are some who in comparing present unsatisfactory conditions with the state of things in former years are ready to claim that the trouble arises from overproduction and that it will not be remedied till the weaker growers are pushed to the wall and the supply reduced to a parity with what is supposed to be the demand. I do not believe it; I do not believe there will ever be overproduction in our business. There are thousands and tens of thousands who can not afford to buy flowers at all when the price is anyways high who would gladly absorb all our surplus in times of alleged overproduction if the price were made to suit. Then why not let them have the flowers instead of dumping them into the barrel? Only the price must be so regulated that all shall have an equal chance.

To my mind the conclusion of the whole matter is that we must agree on and carry out some plan whereby the relation between supply and demand may be more fully recognized and more promptly and uniformly acted upon. Our troubles arise mainly from the fact that the price current as at present understood is an arbitrary and often an entirely fictitious thing. At irregular intervals the dealers, after more or less amicable consultation among themselves, get out price lists, presumably based on the relation between supply and demand. And what is a cut flower price list? It is not too often a *cut rate* price list, a delusion and a snare, a thing to beguile the consignee with, a list to be cut under to varying degrees, depending on the characteristics of the dealer, the bargaining capacity of the purchaser and the kind of a pull he happens to have with the dealer? There is no uniformity of price, no standard of quality, and there can not be so long as we have half a dozen markets in the same city. We must have one market, one authorized arbiter of quality and price, one general clearing house where all the buyers and all the sellers (or their representatives) may come together each day, where the great law of supply and demand may operate naturally to fix the price at which the entire day's supply may be sold. When there is scarcity let competition among buyers advance the price until the demand no more than equals the supply, and when the market is glutted let competition among sellers depress the price until again the demand just equals the supply. But let the stock all be sold and utilized and let all be open and above board, with all buyers and

sellers on a common footing, with no possibility of discrimination in disposing of one grower's stock and slighting another or in making high rates to one buyer and low rates to another.

Whether this can best be done in a general flower market such as are already found in some of the larger European cities, or whether we can improve upon that idea and establish an incorporated "flower exchange" modeled somewhat after the Chicago Board of Trade or similar institutions, is a question I can not attempt to go into at this moment, it is, however, a subject to which I invite your earnest attention after the immediate subject for debate shall have been disposed of. Meantime if I have said anything to persuade you that our present system is inadequate to the needs of the hour and that an imperative necessity exists that we set ourselves at work to better it; if I shall have so far persuaded you that each man will give his earnest endeavor to think out what shall be the very best means for bettering the situation, I shall feel well satisfied that an excellent beginning has been made.

Arboretum Notes.

IX.

The winter just passed has been a severe one on many of the most beautiful varieties of spring flowering shrubs at the Arnold Arboretum. The mild weather throughout fall and early winter, together with the frequent rains, forced many things into bud and leaf and left them in poor condition to withstand the zero weather which came in early part of March.

The result is that very few of the prunuses are in good condition, the flower buds being in many cases killed, most of the rhododendrons are in the same condition, and the magnolias and heaths have suffered considerably. There has not been so much wood killed as usual on half-hardy stuff, the destruction being confined mainly to flower buds on species that bloom early. Weigelas are in much better shape than usual.

That the winter has not been an idle one for Mr. Dawson is evident from the number of boxes of young seedlings and the marks of the pruning knife which are seen on every side.

Good pruners are few and far between, and one is tempted to envy a man like Mr. Dawson who can move along through the rows of shrubbery with knife in hand boldly cutting here and there and transforming crooked or unevenly developed specimens into shapely forms with a touch that seems almost magical.

There are many beautiful and effective shrubs already in bloom.

The double flowering peach is one of the finest of these. The flowers are of a most exquisite shade of pink and the whole tree when in bloom makes a grand show.

Prunus pseudo-cerasus fl. pl. is another superb species, bearing clusters of showy pink flowers, some of the blooms being two inches across.

Pyrus baccata in its many fine varieties is just bursting into bloom. This species should stand pretty near the head of the list as a beautiful spring bloomer, and as it is also one of the most showy in the fall when in fruit its value can not be overdrawn.

Pyrus Sieboldii introduced from Japan a few years ago makes a shapely shrub, being quite dwarf in habit.

Two new species recently received from the Jardin des Plantes, *Pyrus microcarpa macrantha* (white flowered) and *P. Kaido*

(rose), are both well covered with flowers and promise well. The buds on the latter are brilliant red before opening, and in both species the buds are remarkably long.

Ribes sanguinea is now in full bloom, the branches loaded with the pendent racemes of pink flowers. This is not quite hardy here, and requires a slight covering in winter. *Ribes Gordonifolium* in the Rocky Mountains, and supposed to be a natural hybrid has flowers of a peculiar color, being delicately blended red and yellow. This is perfectly hardy. Among the smaller shrubs that attract the attention just now are the popular *Daphne cneorum*, and *D. Genkwa*. The latter is a Japanese species, flowers lilac, appearing before the leaves.

Andromeda floribunda is particularly fine this season, being loaded with flowers. *A. polifolia* with its beautifully shaded pink bells which are borne in umbels on the tips of the branches is also exceedingly pretty.

Spiraea Thunbergii was in full bloom last November. It is in full bloom now, and will not be entirely out of bloom again till next November. What a superb shrub this is. WM. J. STEWART.

Boston, May 8.

Is Primula Obconica Poisonous?

Have suffered two months from what my physician and myself thought was eczema. Had no rest night or day and could not work. After seeing question as to whether *P. obconica* was poisonous I experimented with it and am satisfied that it is poisonous to me. No trouble after the plants were thrown out.

Catskill, N. Y. R. D. MILLER.

—Regarding *Primula obconica* I am convinced that it is poisonous. About five weeks since I had a breaking out between my fingers and on the wrist of my right hand, also on my eyelids and both sides of my nose. The doctor pronounced it Praria ech and prescribed some medicine which cured me, but soon after I cut some more flowers of the primula and am broken out again worse than before. I shall have to throw the plant away, though am really sorry, for it is the best thing I have for small flowers to work into designs. My wife handles the flowers after being cut, but they have no effect upon her. ECKHARDT.

Nashville, Tenn.

—In your last number A. H. Lange seems to think that the flowers of *Primula obconica* do not poison, but I find they are just as bad as the leaves. In making up a design last week I used eight flowers and was badly poisoned—I did not touch the leaves as another person cut the flowers. M. E. POWELL.

St. Peter, Minn.

Hail Insurance.

In the early days of April our city was visited by quite a heavy hail storm (which is unusual in this section) from which we suffered loss with other greenhouses. For several years past we have been members of the Florists' Hail Association, the expense being very small, but until this storm had escaped loss. We at once measured and reported our loss and received a prompt remittance in full payment of same. Through your columns we desire to earnestly commend the Hail Association to all florists as economical, safe and worthy of generous patronage, it being an investment no florist can afford to be without. NEWBY & Co. Loganport, Ind., April 30, 1890.

News Notes.

PETERSBURGH, ILL.—W. T. Stephenson has purchased the florist business formerly conducted by M. L. Fisher.

ALBANY, N. Y.—The project of a fall flower show is being agitated and it is possible that arrangements will be made for an exhibition next November.

SAVANNAH, GA.—The Central railroad is following the excellent example set by the Pennsylvania R. R. and is laying out flower gardens at the stations along the road.

PROVIDENCE, R. I.—At the last meeting of the Rhode Island Hort. Society a very interesting and instructive paper on the "Relation of bees to fruit and flowers" was read by Mr. Samuel Cushman.

BROOKLYN, N. Y.—A "Century Plant" is about to bloom at Condon's greenhouses near Greenwood Cemetery, and it is attracting a crowd of visitors, showing that blooming "Century" plants are of decided value as advertisements.

CINCINNATI.—By the will of Mrs. Mary Elliott Holroyd, the sum of \$10,000 is bequeathed to the city for the erection of a flower market on the vacant Sixth street market square in this city, to be known as the Jabez Elliott Flower Market.

PITTSBURGH.—The new Phipps aquatic house in the Allegheny Parks is now completed. It is a handsome structure of iron and glass. A splendid assortment of aquatic plants have been received and planted in the tanks by Superintendent Hamilton.

SPRINGFIELD, MASS.—The beautiful grounds of Mr. E. H. Barney at Pecowsc, containing nearly 200 acres, are to be added to the city park through the generosity of Mr. Barney. In addition he has set apart a large sum for the maintenance and improvement of the grounds.

SAN FRANCISCO.—The annual exhibition of the State Floral Society will be held at Irving Hall, May 19. Special prizes in addition to the regular list, of \$50 by Timothy Hopkins for the best and most original floral design, and \$25 by Emory E. Smith for the largest and best collection of tea roses.

LOUISVILLE, KY.—The floral decorations at the recent annual dinner of the Blue Grass Club were quite elaborate. The table, set in the monogram of the club, inclosed a field of live blue grass studded with tulips, pansies and other flowers in great profusion. The decorations were arranged by P. Walker & Co.

BUFFALO, N. Y.—The Buffalo Florists' Club will in the future meet in the rooms of the Society of Natural Sciences, in the Library building. The following questions were discussed at the meeting May 13: What is the most profitable way of utilizing the space beneath the benches of an ordinary greenhouse? Answered by Jno. F. Cowell. Is there any way to change the color of the hydrangea from a pink to a blue? By T. Clayton. Is the Papa Gontier rose any improvement generally over the Bon Silence for the retail trade? By W. A. Adams. Is the Papa Gontier as desirable to grow for the retail trade of Buffalo as the Bon Silence? W. B. Milley.

BALTIMORE.—The principal sufferers from the recent hail storm, among the florists, were Samuel Feast & Son, loss about \$1,500; Holliday Bros. \$1,200;

John Cook \$1,000; Henry Eberhardt \$400; Robert Schmitt \$350; F. Berger \$100; John Eberhardt \$500; Joseph Le Brun & Sons \$200; A. Bassler, Catonsville, \$500. Other glass was broken, but the amount and names of owners not yet ascertained. The total loss by florists will probably reach \$10,000. The greenhouses at Patterson Park were also damaged. Cut flower trade is fair, with prices rather low for good flowers. Perles, Niphotos and Gontiers are wholesaling for \$3 a hundred, La France and Mermets \$5, Bons and Safranos \$1.50, carnations \$1.

SPRINGFIELD, ILL.—The memorial services at the tomb of Abraham Lincoln in this city April 15, were attended by about 5,000 people. The floral offerings were not what they should have been for such an occasion, consisting mainly of anchors, pillows, harps and crosses. Nothing emblematical. The handsomest design was an urn sent by Lincoln Park, Chicago. The Society of Minnesota Florists sent a large pillow, which the local papers said was sent by the "State of Minnesota." There were a wreath of laurel leaves from Mount Vernon, twelve wreaths of laurel leaves from the Turners of St. Louis, a cross and anchor from Wisconsin, a wreath of lilies from "W. R. C." and several boxes of cut flowers which were strewn in the vault.

To the Young Men.

[Extracts from a paper read before the New Jersey Social Florists' Club, by John N. May.]

What are the qualifications necessary to make a successful florist? First—A thorough knowledge of his business. Second—Executive ability. Third—Strict honesty in all his dealings.

The studies most suitable to gain a thorough knowledge of the business are the first to consider. This commences with the first day's employment in this business, by watching carefully how the work is done by experienced hands; no matter how trivial the job may appear to be try to do it well and much will be accomplished from the start. As in all other walks of life many things which are not quite to your liking will fall to your lot, yet if you are determined to become a successful florist you will find them come much easier, and it is absolutely necessary that every one should begin at the bottom of the ladder. Cleaning fires, crocking pots, and many other such like jobs are often not the most desirable things to do, yet they are all important and must be thoroughly understood by every one. All these items offer abundant room for study; to stoke fires in the most economical way is a very important item, as waste and extravagance here means a considerable loss of money in a year; the same may be said of every item and branch of employment. Passing on from the rudimentary point, we come to books, magazines, etc. Of these there are a vast number, all more or less instructive. The ambitious student will try to read as many as comes within his reach, and if he is a careful reader will soon begin to discriminate between good, sound, practical writings and mere theoretical articles; while the latter often contain many things that are pleasant to read and feasible enough on paper, yet they are not always safe to follow in everyday life. The former as a rule are the more sure for us to follow, but even with these it is not safe to accept them in their entirety. It is far better to make a note of anything you read and do not clearly

understand and at a seasonable opportunity ask someone with whom you are associated and whom you think can explain it to you; by such means a new light is often thrown upon it.

It has been well said that we live in an age when it is much easier to learn this business than formerly. This means that the opportunities are much greater from the fact that so many able men have spent years in gathering together valuable data and publishing the same in book form for our benefit and instruction. Such fine works as London's Encyclopaedia of Plants, Thompson's Gardener's Assistant, Rhind's Vegetable Kingdom, Gray's Manual of Botany, etc., were not in existence in the last century, and the gardener then had to spend the best half of his life in acquiring the knowledge that was to support him in the other half. In this our favored time we have the opportunity of profiting from such works as above named and hundreds of others, and by close study learning our business in a much shorter time. But right here let me say that the requirements today to compete successfully in business are much greater than formerly; therefore we have so much more to learn and it is only by close application, careful study and determination to overcome all obstacles that we can hope to succeed. And, although we have so many advantages over our forefathers in gaining knowledge, yet I would earnestly advise you all not to try to run before you can walk, but rather spend a few years longer in gaining a good general knowledge before embarking on your own responsibility; it will be both time and money well spent.

The second item we touch upon is executive ability, this is all important, and for the young beginner requires a special study. A man may be one of the best plantmen in the country, but if he is not able to direct and manage workmen successfully he will never make a success either as a foreman for others or to manage a business for himself. Therefore in traveling around the country from place to place in search of knowledge do not overlook this. A safe plan to follow is to observe where the business is the most carefully and economically managed without waste or surplus labor, yet is done with consistent consideration of all concerned, and try to grasp the whole thing so that you can when called upon do as well or better—I say better here because our aim should always be to improve upon all we learn.

This brings me to the last item I shall speak upon, namely honesty and fair dealing. I need hardly say to you that this is not the least in importance. No man can hope to conduct a business and retain the respect of honest men unless he follows the golden rule, "Honor before Riches." And the word honesty opens up a wide range. It means not only that we must not openly rob our fellow man but it has a very much wider range. It is just as dishonest to waste time by idleness, to recklessly destroy property, or tell an untruth to cover a fault, as it is to take something which does not belong to us. To waste time by idleness while in the employ of others is doubly dishonest by robbing our employer of what is justly his and also robbing ourselves, as it is soon discovered and we are made to suffer in consequence. Almost any employer can soon tell if a boy or man is idling his time away, and it is only a question of a short time before the idle boy or man loses his situation and his employer's good wishes, and you can all readily understand the consequence.

On the other hand any reasonable employer will endeavor to encourage by kind words and deeds the efforts of all who try to faithfully discharge their duties, and are careful not to waste or destroy anything he can possibly help. And let me lastly, impress upon you the absolute necessity of truthfulness in all things, to yourself, your fellow workman and your employer. It is, and always will be, the first grand corner stone toward building up the successful business man and do much to elevate our calling to the highest plane.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Flat ads. not admitted under this head.

THE CUT FLOWER TRADE.

The cut flower trade continues to grow and the necessity of new methods to meet new conditions of trade continually presents itself. And certainly the most crying need is some standard of classification as to quality. One which shall be universal throughout the whole country and be simple and easily understood. Then buyers could order intelligently and know what they were going to get, and consignors of poor stuff would know why their returns were small. Then every grower's stock would rest solely upon its own merits. We must keep pace with the times, and some sort of a classification is positively demanded to meet existing conditions.

As this must be national to be of the fullest service, the matter should certainly be taken in hand by the National Society. We suggest that some one be appointed to formulate some plan of classification to be submitted to the next convention. In the mean time our columns are open for suggestions and discussion.

COST OF PRODUCTION.—Regarding this subject a large cut flower grower writes: "The space occupied, in square feet is the safest guide as to results, say how much in dollars and cents does a certain rose yield during the season for each square foot occupied. If a grower can realize \$1 per square foot from what he has under cultivation he ought to make money if growing cut flowers; but in handling pot plants more labor is involved, consequently he should realize a larger amount per square foot in order to make the same profit."

SOME really good blooms of Chrysanthemums Mrs. Heale, Mrs. Jessie Barr, Mrs. Irving Clarke and Jeanne Delaux have been sent by Mrs. S. P. Gardner, Hinsdale, Ill. She states that they were cut from plants in 4-inch pots—January struck cuttings—which having shown a tendency to throw flower buds, had been disbudded to one or two buds and allowed to bloom with the result of some very good flowers. Chrysanthemums in May, and good ones too, indicate that the "Queen of Autumn" is making a successful effort to extend the boundaries of her realm.

MR. E. HOLDEN, gardener to Robert Garrett, Esq., Uplands, Carroll, Baltimore Co., Md., sends us a specimen muskmelon which he states is a hybrid of his own, of robust habit, very free and the best for forcing he has ever grown. The melon sent was of good size and of excellent quality. The flesh is pale red in color, nearly all edible and of unsurpassed flavor.

SOUVENIR de Francois Gailain, Mdle. Augustine Guinoisseau and Souvenir du Baron de Rochetaille are the impressive names attached to three of the new French roses. Convenient little mouthful, aren't they? And wonder what they will look like after they have been the rounds of the catalogues.

QUITE A NUMBER of our readers have forwarded to us letters received from their Congressmen in acknowledgment of the protests against the proposed import duty on plants sent them, showing that a considerable number have made use of the blank form for protest mailed in a recent issue.

BEGONIA DAUGHTREY.—Mrs. Daughtrey writes that the name of her new begonia is that with which this paragraph begins, and that the title "regina" which has called forth a criticism was added by the reporter for the local paper without her consent.

MR. CHAS. L. MITCHELL, Cincinnati, writes us that we have been misinformed as to his having any interest in the Huntsman Floral Co. of his city. He states that he has none whatever.

THE NEW YORK daily papers seem to be worrying themselves considerably over the present whereabouts and future plans of Florist C. F. Klunder.

THE QUESTION now is: What effect will the unusual season have upon the supply of outdoor flowers usually available for Memorial day, May 30.

LATE FROSTS are reported to have done serious damage to fruits and hardy flowering shrubs at many points throughout the west.

Coming Exhibitions.

June 24—25, Boston.—Rose and strawberry exhibition Mass. Hort. Society.

August 19—22, Boston.—Annual exhibition Mass. Hort. Society.

October 28—Nov. 1, Atlanta, Ga.—Chrysanthemum show, Piedmont Exposition Co.

November 4—6, London, Ont.—Chrysanthemum show, Gardeners' and Florists' Club of London.

November 10—14, Philadelphia.—Chrysanthemum show, Penna. Hort. Society.

November 11—13, Boston.—Chrysanthemum show, Mass. Hort. Society.

November — — — Chicago.—Chrysanthemum show, Chicago Florist Club.

November — — — Cincinnati.—Chrysanthemum show, Cincinnati Florist Club.

November 11—15, Indianapolis.—Chrysanthemum show, Society of Indiana Florists.

November 11 — — Montreal, Canada.—Fall show Montreal Gardeners' and Florists' Club.

November 12—13, Worcester, Mass.—Chrysanthemum show, Worcester County Hort. Society.

Nurserymen's Convention.

The fifteenth annual meeting of the American Association of Nurserymen convenes at the Park Avenue Hotel, New York City, June 4.

Among the essayists and speakers will be Professors I. P. Roberts, L. H. Bailey, J. L. Budd, B. E. Fernow, B. T. Galloway; also Hon. H. E. Van Deman, chief of the division of pomology, A. S. Fuller and many practical nurserymen.

Reduced fare has been secured upon all railroads east of Chicago, and reduced rates at the hotel. Any further information

desired may be obtained from Chas. A. Green, secretary, Rochester, N. Y.

Historical.

Continuing your history in the way of the earliest issuing of catalogues in Chicago, we have before us the following, probably the earliest of each firm's issue, having always been curious in these things, and having some thousands saved since about the year 1853.

Martin Lewis, of the Sheffield Avenue Nurseries, which contained greenhouse plants, 1862; A. T. Williams, 1864; Blumenschein Brothers, 1861; Sulzer Brothers, 1863; M. Miller & Son, 1868; Pool's Botanic Garden, 1866; Robert Pouley, 1867; Pettingrew & Reid, 1870; Samuel Muir, W. B. Farrell, and William Lill, without date, but previous to 1870.

The first seed store in Chicago was undoubtedly Hooker & Jones, who in 1857 were at 107 Lake street. We understood they originally had a general store, with seeds in the spring, finally branching out into seeds and implements. The next was H. D. Emery & Co. who started about 1854 or 5, at 204 Lake street. The next to start was A. H. Hovey, also on Lake street, and early in the 60's.

The first greenhouses erected, according to a long account given by C. H. Bragdon in the Chicago *Republican* May 4, 1866 of the florists then known and other horticultural data, and obtained from Samuel Brooks the first florist in Chicago, appears as follows: There were but one or two greenhouses built in the city prior to that of Mr. Brooks (1844, corner of Clark and Adams); one had been erected by Henry Thomas on North Clark street, and another by the Hon. Wm. B. Ogden. The latter was Chicago's first mayor, and the greenhouse likely on his old homestead on the north side. The A. T. Williams before mentioned who issued a catalogue in 1864, built his first greenhouse as a florist in 1855, came west as a gardener to W. B. Ogden about 1853. Out of the list of the 18 firms noted by Mr. Bragdon in 1866, no less than 11 are no longer in existence, while seven are still battling among Chicago's list according to the AMERICAN FLORIST's directory of 126 firms.

Do you know that your list contains a total of 6,687 names? Of these, nurserymen alone count 431. Nurserymen mixed with florists and seedsmen about 400, making nearly 1,000, more or less, in the nurserymen's class. The seedsmen and combinations foot up 450, or so, while those having something to do with flowers, or listed as florists, come up to very near 6,000 names. Fifty years ago there was not probably a score of exclusively florists in the country.

The first permanent bouquet store in Chicago, where work was made up away from the gardens, was opened by the writer March 5, 1867. Early in April Mr. Reissig was also in the field. Previous to that time stores were opened up for the spring months; the first by myself in a basement at the northeast corner of Dearborn and Randolph streets in March, 1859.

EDGAR SANDERS.

WORCESTER, MASS.—The free class in botany will soon begin work at Natural History Hall. An evening class in plant analysis is talked of, and the indications are that it will be very popular. It will be under the direction of J. Chauncey Lyford. Wild flowers will be taken as they appear from week to week for subjects. The floral display at the last monthly exhibition of the Worcester Hort. Society was exceedingly creditable.

NEW BEDFORD, MASS.—E. Y. Peirce is arranging to add a new greenhouse 75x12.

DENVER, COLO.—Mr. and Mrs. Gallup have returned from a seven weeks trip through old and New Mexico and Texas.

OSKALOOSA, IOWA.—The Kemble Floral Company has added 7,500 feet of double thick glass to their plant this spring, to be used mainly for roses.

SEED TRADE ASSOCIATION.

H. W. JOYNSON, Philadelphia, president; ALBERT M. MCCULLOUGH, Cincinnati, secretary and treasurer. The eighth annual meeting at Saratoga Springs, N. Y., June, 1890.

Uncle Sam's Big Seed Barn.

WASHINGTON, D. C., April 24.—Uncle Sam's seed barn is just now in a hum of activity. It is so for about a month every year at this season. Gointo it any time during the next two or three weeks and you will find it a scene of bustle and industry—hundreds of women putting up with rapid fingers myriads of paper packages, men dragging heavy sacks hither and thither, and other busy workers pasting and addressing labels. They must needs be quick, for within a few days \$100,000 worth of seeds of all sorts have to be sent in small parcels to a million different individuals in all parts of the United States. That is the sum annually appropriated by Congress for investment in germs of things vegetable, to be distributed throughout the country in order that products of the soil may be improved in quality. If you would like some you can get a share by simply writing without delay to the Department of Agriculture, Washington—a postal card will do—and making the request. Mention what you want and it will be mailed to you free of charge in a bundle marked "Official Business." If you have no place to grow beans and potatoes in, ask for flower seeds and you will receive enough to make your garden bloom for an indefinite period. Any one can obtain a portion by merely communicating the wish.

Probably this newspaper will not charge anything for advertising the fact that Uncle Sam is distributing this year seeds of a better quality than ever before. Some time ago the seeds given away by the government acquired such a reputation for badness that many farmers would not even take the trouble to plant them, considering it improbable that they would ever come up. But things are managed differently now, and the seeds you get from Uncle Jerry Rusk are accompanied by a guarantee that they will sprout. They are all tested, in fact, before they are sent off, and the manner of this testing is exceedingly interesting.

First, however, it will be best to tell where the seeds come from. Hitherto they have been bought from farmers and seed growers, who sent samples to Washington and received orders on the strength of them. But this year an agent has been employed to travel all over the country and buy up whatever seemed best. The result is that all the seeds now being distributed are exceedingly fine, and the department represents a certain potato it is sending out as probably the most excellent article in the shape of a Hibernian tuber ever obtained by cultivation. It never offered potatoes before this season, by the way. The germs of this wonderful vegetable will be sent to you, if you make the request, 25 "eyes" in a wooden box, all cut up and ready to plant. Of course the notion is that the farmer, observing that the potatoes grown from these 25 eyes are superior to any others of his crop, will keep them for seed, and other agricultural persons in his neighborhood will obtain from him specimens of the vegetable for planting, the product of all that particular district being in this way improved. Such, indeed, is the whole idea and purpose of

the seed distribution—that the vegetables and flowers grown in this country shall be as good and pretty of their kinds as possible.

The seeds bought of the farmers by the agent are sent to Washington in bags, and in this shape are piled in the storage department of Uncle Sam's barn, which is a big brick building just back of the main structure of the Department of Agriculture. An enormous room adjoining is filled with pretty young women sitting at little tables and measuring out seeds from sacks into brown paper envelopes. Some of them use quart pots, others pints, and so on down to mere thimbles with long handles for such little seeds as carrots. Obviously, too, the envelopes differ in size. Each envelope, having received its measure full, is sealed up, and a label is pasted on it, telling what seeds it contains, giving directions for planting them and saying at the bottom: "Please report results." It is desired to know, you see, how the seeds turn out. Finally the packets are put up in bundles of five and tens, and after being addressed they are sent off in this shape. If you ask simply for "some vegetable and flower seeds" you will probably receive ten envelopes of the former and five of the latter. A sample bundle of ten vegetables would very likely contain a quart of corn, half a pint of beans, half a pint of peas and some small envelopes of cabbage, pumpkin, tomato, pepper, radish, cucumber and beet. Quarts are also given of buckwheat and lawn grass. A separate room in the barn is devoted to the putting up of flower seeds, which are purchased from the big seed houses. * * *

Write to the department for the seeds you want and you are all ready to go into business. Own your own kitchen garden; every city family should have one on the window ledge. Flowers will do as well.

Two thirds of the \$100,000 worth of seeds go to Congress, each member of which gets about 5,000 envelopes of them yearly. Usually the department sends them off under instructions from the Congressmen. The remaining one third is distributed by the department as it sees fit. Its generosity is often abused, for people sometimes send as many as a dozen times for seeds in one year. As a rule they get them, too; for it is the policy of the department to be very amiable and to conciliate everybody.—*Brooklyn, N. Y., Times.*

Why don't U. S. go into the grocery business as well?

Import Duty on Catalogues.

The following letter explains itself and reflects great credit on the enterprise of the Custom House officials:

TREASURY DEPARTMENT, OFFICE OF THE SECRETARY.

WASHINGTON, D. C., May 3, 1890. MESSRS. BLANC & Co., Philadelphia, Pa., *Gentlemen:*—Your letter of the 29th ultimo, addressed to the Hon. John Wanamaker, Postmaster-General of the United States, having been referred to this department for proper consideration, you are informed that importations (*) of printed matter (seed catalogues) of the character described by you and sample of which is submitted, are properly dutiable at the rate of 25 per cent. ad valorem under schedule M, paragraph 384, Act of March 3, 1883.

Your sample is herewith returned.

Respectfully yours,

GEO. C. TAIB, Asst. Sec'y.

[* These were single catalogues, priced lists, sent by mail to Messrs. Blanc &

Co., who mailed us the wrappers of the same.—Ed.]

Violet Crops.

Mr. Geo. Klehn, Arlington Heights, Ill., gives in detail the number of blooms cut from his violet house, 10x125, from Oct. 21, 1889 to Jan. 20, 1890, as follows:

Oct. 21.....	200	Dec. 25.....	800
" 23.....	200	" 27.....	300
" 29.....	300	" 28.....	1000
Nov. 5.....	600	" 29.....	300
" 8.....	200	" 30.....	200
" 9.....	200	" 31.....	1800
" 12.....	1100	Jan. 1.....	100
" 16.....	300	" 2.....	300
" 18.....	200	" 3.....	400
" 19.....	500	" 4.....	500
" 22.....	400	" 6.....	400
" 27.....	2000	" 7.....	400
Dec. 3.....	1300	" 8.....	400
" 5.....	200	" 9.....	400
" 7.....	200	" 10.....	400
" 9.....	200	" 11.....	400
" 10.....	500	" 13.....	1000
" 12.....	200	" 14.....	400
" 13.....	200	" 15.....	400
" 16.....	300	Jan. 16.....	1050
" 18.....	300	" 17.....	400
" 21.....	800	" 18.....	900
" 23.....	1000	" 19.....	1200
" 24.....	4500	" 20.....	500

A total of 29,850 blooms, making an average of about 30 blooms from each square foot of bench during the four months.

We also give his record for the previous season, from Nov. 1, 1888, to April 20, 1889.

Nov. 1.....	200	Feb. 18.....	1500
" 3.....	200	" 20.....	2000

" 11.....	1800	" 11.....	1000
" 13.....	1600	" 12.....	800
" 15.....	2000	" 13.....	1000
" 16.....	1900	" 20.....	3000

A total of 106,300, making an average of 106 blooms from each foot of bench during the season. The incompleteness of the record for the past season makes a full comparison impossible, but enough

is given to show that Mr. Klein is correct in his assertion that his violets have not done as well in the season just past as the year previous.

—Mr. Jos. Renard, Unionville, Pa., sends us the following record of violets cut from two houses each 100x9, from October 1, 1889, to March 1, 1890. One half the plants were Marie Louise, one fourth Neapolitan and one fourth Swanley White.

October.....	17,875
November.....	31,750
December.....	24,200
January.....	32,300
February.....	28,025

A total of 134,150 blooms, making an average of about 89 blooms from each square foot of bench space during five months.

—Heathcote, Kingston, N. J., writes: I have 2,847 clumps of the Marie Louise in a house 100x18. They are in two borders each 8 feet wide with a two-foot walk between. From them I have picked 102,615 blooms from November 1 to March 1, a period of 120 days, making a daily average of 855 blooms.

Picked in November.....	7,740
Picked in December.....	19,550
Picked in January.....	34,250
Picked in February.....	41,075

102,615

They are still blooming freely, enabling me to pick over 10,000 each week, and I am reasonably certain of obtaining over 150,000 blooms before the season closes.

The temperature is regulated by one 4-inch pipe set just inside the outer wall, a foot above the plants. Ample ventilation is obtained by having the sash on the lower end of rafters for about four feet above the plate moveable, and so arranged as to be entirely removed if necessary. With an outside temperature of zero I have had no trouble to keep above 35° inside. The house is only eight feet to the ridge pole.

My record of blooms as sent to you was up to March 1. Since then for week ending March 8 I picked 10,400, for week March 15, 14,000, this week will exceed 10,000. The crop for this month will exceed any previous one, and the daily average is increasing—is now over 900—and by the middle of April when I put them out will no doubt be 1,000.

I will then use this house for tomatoes in 10-inch pots, which I will then have ready to set in. I am going to try "The Lorillard," "Livingston's Beauty" and "Dwarf Champion." I estimate I will have room for 300 plants.

The Brick Flue.

In answer to J. C. R., on page 468 of your last issue, I would say that soft coal can certainly be used in the "old fashioned" brick flue without the gas injuring the plants. We have one in one of our houses that has been in use for a number of years. It is laid up with clay instead of mortar and gives us no trouble whatever. I would not advise a flue, however, as steam is much better and more reliable at much less cost after one in.

G. R. MINER.

Hornellsville, N. Y.

Our new trade directory is now ready. Price \$2. Order a copy now.

5,000 Verbenas, 3-inch pots, \$1 per 100; 2½-inch pots, \$3 per 100. All in bloom. Free from rust and mildew. Verschaffeltii and Golden Bedder Coleus, 2½ in. pots \$3.00 per 100; \$4.00 per 100.

NARCISSUS.

An immense collection and an enormous stock of all the leading varieties, especially of those adapted for forcing. Many acres are now in flower, and I expect I shall have at least

A MILLION

of fine forcing roots to offer this season, and shall be pleased to give prices for any variety for **EARLY FALL** Delivery. A preliminary list has been sent to my customers, and my General Trade Catalogue will be ready shortly.

CLEMATIS.

My stock for Fall delivery will be much heavier than previous seasons. The varieties consist of all the best kinds and may be relied upon. Also many other varieties of Hardy and Half Hardy Climbers.

PYRETHRUMS.

Many thousands of these are grown and form one of the most important families of my Florist Flower Department. Also Carnations, Phloxes, Delphiniums, Pansies, Pinks, Hollyhocks, etc.

HERBACEOUS PLANTS.

The increasing demand for this group, both at home and abroad, has necessitated my adding several acres of fresh stock, in addition to my usual stock which is immense. Every good hardy plant is grown in large quantities, and I shall be pleased to quote prices for anything required.

DAHLIAS.

An extraordinarily complete collection, every variety of every section worth cultivating will be found described in my Retail Catalogue, published in April. Trade list of Pot Roots published in the Autumn.

HARDY BULBS.

Many acres grown, forming the most important branch of my Establishment, Anemones, Lilies, Chionodoxa, Gladiolus, Begonias, Montbretias, and hundreds of other families too numerous to mention here.

INDUSTRY GOOSEBERRY.

I have a good stock of this for Fall delivery, and shall be pleased to quote lowest price upon application.

CHRYSANTHEMUMS.

Every variety up to date, including English and Continental, full descriptions of which will be found in my numerous Catalogues, which may be had on application.

A. HULSEBOSCH,

P. O. Box 3118. NEW YORK CITY.

Boston.

The cut flower trade has experienced a slight revival since the last report, and trade seems to be quite steady. There is a fair sale for good roses. Carnations are more abundant and prices have dropped. Violets are still in the market but a few warm days will finish them. Pansies are coming in by the bushel and are not worth the trouble of picking. Lilies are not plenty, and callas are getting scarce. Smilax remains scarce and price high for inferior quality. There is a good supply of outdoor tulips. Lily of the valley is still of the indoor kind but it will soon be in bloom outside. Hydrangea plants are particularly handsome this season.

The Gardeners' and Florists' Club held its regular monthly meeting on Tuesday, May 6. The subject for discussion was the "Cut Flower Commission Business," an interesting paper on which was read by Mr. N. F. McCarthy. The subject was handled with caution, and as the same spirit seemed to pervade the audience everything went remarkably smooth considering the dangerous character of the question, so that those who came to the meeting expecting to see a circus went away disappointed. Other matters which were disposed of were some committee reports on certain preparations for the approaching meeting of the S. A. F., and the expression of the club on the matter of duties on bulbs and plants as requested in a communication from Mr. W. Kolker. Had it been generally known in advance that this latter subject was coming up there would doubtless have been some lively talking done. As it was, all the growers present recorded themselves as strongly in favor of the abolition of all duties on plants and bulbs.

Jackson Dawson has a large bed of superb hybrid primulas of which he is justly very proud. W. J. S.

MICHEL PLANT AND SEED CO. ST. LOUIS 3 MO.

Chicago.

F. Calvert & Son of Lake Forest, are building a new house 28x100 for American Beauty roses.

Mr. Frederick Mau's sale of orchids at Elison, Flerhsch & Co.'s auction room on April 29 was well attended by both florists and amateurs. Some 400 plants were sold, all at fair prices, and Mr. Mau expressed himself as well satisfied with the results of the venture. A few plants of rare varieties were not sold, but the standard sorts of cattleyas and other orchids whose flowers are useful to florists found ready sale.

Schiller & Mailander have removed their city store to 730 West Madison street.

The tulips and hyacinths are now in gorgeous bloom at the parks.

At the trade meeting held at the Sherman House, Saturday, May 10, the report of the committee appointed at the previous meeting was read, and after considerable discussion, a committee consisting of Messrs. Jas. D. Reynolds, J. T. Anthony, F. F. Bentley, Geo. Klehm and Nicholas Singler, was appointed to secure a charter for a corporation to be known as the Chicago Flower Exchange, and to obtain the names of all desirous of taking stock in the enterprise. The committee was also given power to appoint further committees to assist them in the work of securing members, and to call another general meeting at such time and place as it deemed desirable. In the discussion it was plainly shown that considerable time would be necessary to perfect the organization and put the project of an exchange into practical operation, but the feeling was general that a good foundation had been laid.

At the next meeting of the Florist Club there will be a discussion as to what action the club shall take at this time toward assisting to secure the greatest success for the horticultural department of the World's Fair of 1893.

ORIGINAL AND LARGEST GROWERS OF

Lilium Harrisii Better known as The Bermuda Easter Lily

The Best in the World for Forcing for Winter Flowers.

WE OFFER ONLY STRONG FIELD-GROWN BULBS FROM
 OUR OWN GROUNDS IN BERMUDA.

THIS VALUABLE LILY IS OUR SPECIALTY.

We grow the bulbs by the acre on our own grounds in Bermuda. We were the first to grow it in large quantities and to offer it at reasonable prices, and we have always been recognized by the trade as

HEADQUARTERS FOR THE BERMUDA EASTER LILY.

Supplying the trade as we do both in this country and in Europe, and we hold by far the largest and the controlling stock of the genuine variety in the market.

The extent of our operations in this bulb alone will be best understood when we state that we expect to sell from OUR CROP of 1890, over a

HALF A MILLION BULBS.

Be sure you get the genuine Lilium Harrisii. In order to secure "the true variety," purchase your Bulbs from original stock, which is known to be pure. The value of this Lily has led unscrupulous or ignorant parties to plant L. Longiflorum in Bermuda, or grow it there one season and send it out as Harrisii, and dealers should look with suspicion on bulbs offered at prices less than market rates, as the supply has never yet met the demand: "Mixed Bulbs" only being offered at reduced rates.

This is not only the best by far of all lilies for winter blooming, but it is one of the most profitable flowers that can be grown by florists. It is very easily handled, and the flowers being especially effective for decorative purposes, always command large prices. From its name some have thought it was a bulb for florists' use for forcing for the Easter market only. This is not exclusively so; it derives its name from the fact that, in Bermuda, grown in the open ground, it blooms at Easter time—hence the name "Bermuda Easter Lily"—but by growing it in this country in the greenhouse, with successive lots, it can be had in bloom all the winter from early in December until after Easter; in fact, by special culture, all the year round, or as long as cut flowers are in demand. The fact that it can be forced into bloom by the Christmas holidays adds particularly to its value, as it fills in at a time when flowers are usually scarce and in great demand at high prices, but to accomplish this the bulb must be potted early in August, something depending upon after treatment and temperature the bulbs are grown in.

For this purpose our Bermuda-grown bulbs are indispensable, as in Bermuda the bulb reaches its highest development, and ripens off perfectly, and is ready for shipment usually by the middle of July—before bulbs in our country have hardly begun to make their growth. Our bulbs being grown in the open ground, in a climate naturally adapted for their perfect growth, are particularly strong and healthy at any time.

New Crop will be ready for delivery early in August. Orders booked for delivery at that date.

Large growers or dealers in this bulb should write us for special prices, stating quantity of bulbs desired, and we will give lowest estimate on the same by return mail.

F. R. PIERSON & CO.,
 TARRYTOWN, NEW YORK, U. S. A.

A. T. CEFREY'S

Patent Improved
Florists'

Immortelle Letter and
Pin Fastener.

A. T. Cefrey

THIS Company takes an especial pride in presenting to the Florists of America, their Patent Improved Letter for Floral Work, invented, patented and perfected by Mr. A. T. CEFREY, the originator of the Immortelle Letter for Floral Designs, and who, for many years has occupied a leading position amongst his brother Florists for his original and artistic efforts in all that pertains to the floral profession.

We offer to our patrons a **FRENCH IMMORTELE LETTER**, perfectly made by machinery, and covered with **GENUINE IMPORTED FRENCH IMMORTELES**, in Violet, Blue, Scarlet or Pink. We send each separate letter enclosed in an envelope, containing, also, our patent **COVERED IMMORTELE PIN FASTENER**, which can be attached to the letter simply and expeditiously, and will hold the same securely and firmly in place on the design.

The beauty and symmetry of our goods have been the admiration of all who have seen them. Nothing equal to our letters has ever before been attempted. They are not only superior in workmanship, material and general excellence to the old **IMMORTELE LETTER**, but, what is of the utmost importance to florists, they are almost indestructible, being *made by a patent process*, almost as hard as iron, and we guarantee that they will stand transportation, and can be safely sent by mail or express to any part of the country.

It has been our aim to place our goods in the hands of the trade at rates, that, with their great advantages, will ensure for them a ready sale, and will also, from the unusually low prices, largely extend their use in the country.

Florists have heretofore experienced much loss and inconvenience in handling this class of goods, as, being exposed to the air, they lose their brilliancy of color. We enclose each separate letter in envelope, marked upon the outside with the name and color. Each package will be marked with a fac simile of the signature of the inventor, and all infringements will be prosecuted to the fullest extent of the law. 10 cents per hundred for postage.

The Price of the Letters, including the Pin Fastener, is \$2.00 per Hundred.

ADDRESS ALL ORDERS TO

CEFREY FLORISTS' LETTER CO.

37 TREMONT STREET, BOSTON, MASS.

A Lesson in Botany from the Hub.

A very funny plant in the government botanical garden is the so-called barber plant, the leaves of which are used in some parts of the east by rubbing on the face to keep the beard from growing. It is not supposed to have any effect on a beard that is already rooted, but merely to act as a preventive, boys employing it to keep the hair from getting a start on their face. It is also employed by some Oriental people who desire to keep parts of their heads free from hair, as a matter of fashion.

Also found in the botanical garden is the "cruel plant," which is so designated because it catches butterflies and kills them for sheer sport. Its flowers attract the poor little flitterer by the honey it offers, and when the victim lights upon it it grabs the butterfly by the head and holds it fast until the captive dies. Then the flower drops it on the ground and lies in wait for another unfortunate.

A curious looking tree from the Isthmus of Panama bears a round, red fruit as big as an apple, which has this remarkable faculty, that its juice, rubbed on tough beef or chicken, makes the meat tender by the chemical power it possesses to separate the flesh fibre. One is interested to observe in the botanical greenhouse three kind of plants that have real consumption of the lungs—the leaves, of course, being the lungs of a plant.

The disease is manifested by the turning of the leaves from green to white, the affection gradually spreading from one spot until, when a leaf is all white, it is just about to die. Cruelly enough, as it would seem, the gardeners only try to perpetuate the disease for the sake of beauty and curiosity, all plants of those varieties that are too healthy being thrown away.—*Boston Transcript.*

THE BUFFALO Florists' Club has issued an advance sheet of premium classes for a chrysanthemum show to be held next fall. Copies may be obtained from the Secretary, Mr. Dan'l B. Long, 457 Main street, Buffalo, N. Y.

Long Island Notes.

BY WM. FALCONER.

A BIG CACTUS FOR ENGLAND.—A splendid specimen of *Cereus giganteus*, 12 feet high and weighing about 1,500 pounds has recently been shipped to England, to order, by one of our florists.

THE RAINBOW CACTUS (*Echinocereus candicans*).—A Philadelphia florist has sold, within a year, over 6,000 plants of this beautiful species.

PERENNIAL PHLOXES FROM SEED.—If you wanted to raise them you might meet with some difficulty, for they don't always respond very kindly; but this spring self-grown seedlings came up about our old plants more than thick as crab grass in a corn field.

HERBACEOUS PÆONIAS, Canterbury bells, foxgloves, border pinks and sweet williams are some of the hardy perennials that behaved very well with us when forced for early spring.

"GENISTA CANARIENSIS", PAGE 402.—The proper name of this plant is *Cytisus Canariensis*, and the plant known as *Cytisus racemosus* is only a variety of *C. Canariensis*. Instead of *cytistus* they used to be called *genista*, and if friend McKenna looks through the back numbers of the *FLORIST* he will find these plants often spoken of as *genista*. In London's *Encyclopædia of Plants* the name is given as *Genista Canariensis*. And that is the way it goes; the botanists keep tossing the plants from one species to another and from one genus to another, backward and forward, till we poor sinners of growers get so befuddled that we often don't know which name is right.

THE COMMON BROOM.—"The yellow broom" is also a *cytistus*. It used to be called *spartium* and also *sarothamnus*. You know it's the botanists' business to do this sort of thing, and our business to keep up with them and posted, and there isn't a bit of use in our growling about it. By the way, what a lovely shrub the yellow broom now is. It comes into bloom about the 9th of May and lasts in fine flower well into June. But it isn't always hardy.

CRIMSON-BUDDED SIBERIAN CRAB APPLE FLOWERS.—On May 7, for a family party in New York, among other flowers I sent in a lot of densely budded sprays of a crimson-budded form of *Pyrus baccata floribunda* cut from little trees growing out of doors. And I was informed that they had been selected by the ladies and worn by them as corsage flowers, and they pronounced them "perfectly charming."

THIS SECTION OF CRAB APPLE, and the now much advertised *Pyrus Parkmannii* belongs to it, contains some of the loveliest of all hardy ornamental flowering shrubs or small trees, and they blossom full when only a foot or two high. The

flowers are prettiest in the bud and immediately before opening. The fruits are no larger than peas.

GLADIOLUSES FROM SEED.—Have you observed how much harder one-year old bulbets are than mature bulbs? All the little bulbets left in the ground last fall have come up this spring as freely as if they had been newly-sown grain, and without any restriction from their leathery skin as is usually the case with unpeeled one-year old newly planted sets. At the same time I should disavow anyone leaving his bulbets in the ground all winter, the risk is too great.

GALTONIA (*Hyacinthus*) CANDICANS is hardy enough however, that is in the case of small bulbs, say up to three years old. But I have found very old bulbs to rot off in the ground in winter, while younger ones around them were perfectly healthy.

CLIVENED PANSIES.—Again let me call your attention to these. They are not large, showy pansies for plucking as are the Trimardean, they are what we call bedding pansies, that is, pansies used in masses in spring flower gardening. The colors are clean white, clean yellow, and purple. The plants are of compact habit and extremely profuse; indeed they are the finest pure white and pure yellow bedding pansies I know of. Clivened is the name of the Duke of Westminster's country seat in Berkshire, England, and quite famous for its vast display of spring flower gardening, this fine strain of pansies is the one grown there and improved and perpetuated by careful selection. It comes true from seed.

HARDY DOUBLE-FLOWERED PRIMROSES.—From John Thorpe, a year ago, I got a set of these little beauties, and what charming old-fashioned gems they are. Among them are white, yellow, lilac, purple, red, and crimson flowers and all bloomed beautifully. The purple was the most vigorous and copious, and the crimson had the largest blossoms. I grew them in a cold frame alongside of polyanthus and English wild primroses. We must deal carefully with these double primroses, for they dislike our hot, dry summers, and as we cannot raise them from seed we have got to save our old plants. To increase the stock divide them when growth begins again early next fall, or wait till end of March and then divide them. I have always found it an unsafe plan to divide these primroses just after they have done blooming, very early in May.

ETALIA JAPONICA VARIEGATA didn't live as well last winter as it did in previous years, but the typical green-leaved form and the zebra variety came through the winter as sturdily as ever.

NIGHT-BLOOMING CERES (page 408) is an unhappy name because indefinite, it may refer not only to different species of

TWENTY-EIGHT PAGES again.

ARE you arranging your business plans so that you may safely leave home in August to attend the Boston convention of the Society of American Florists?

ARRANGEMENTS will be made for special cars from Chicago to Boston in August, and florists in the west will be invited to travel with the party from that city. Should the number be sufficient to warrant it a special train will be provided.

one genus, for instance *Cercus triangularis* or *C. Macdonaldæ*, but also to members of different genera, for example *Cercus grandiflorus* or *Phyllocactus latifrons*.

"OLD SEEDS that may germinate in the hothouse may fail in the garden," page 410. During the winter and early spring months the greenhouse is our only available means of growing seeds, as it also is in the case of extremely fine seeds as of begonias, tender plants like palms, etc. but in the case of ordinary garden seeds, I can always get a larger per centage to grow under outdoor than indoor treatment.

A GOOD FUMIGATOR.—I wish some of your practical correspondents would tell us something about a first class fumigator, if there is such a thing in the market.

NARCISSE.—The long and eulogistical editorial and communicated articles about these lovely flowers in the English horticultural press are very gratifying, but we cannot fully emulate their example. To begin with, many of the species and varieties that are hardy there are not hardy here, in several cases different varieties are so much alike that it takes an expert to distinguish them from each other, and too, the fancy kinds are by far too high priced to become popular.

POPULAR PRICES.—A neighbor of mine, a florist who runs a retail plant business, speaking to me the other day about chrysanthemums said: "I am compelled to get all those high-priced chrysanthemums every year as they come out, but they don't pay me the first year, in fact there is no demand for them, for one plant that I can sell at a dollar I can sell a hundred at 10 or 15 cents."

PASSIFLORA CERULEA and its varieties lived out of doors with us last winter, that is under a mulching of litter, this is something unusual, however, and no doubt due to the very mild winter.

PENNISSETUM LONGISTYLUM is a very ornamental Abyssinian grass that we usually treat as annual, but on light land and under a heavy mulch it has lived through the winter very well. This is very unusual, and it is not of any advantage, for young plants are very easily gotten up from seed and they make better specimens than old ones.

CENTRAL PARK LAWN GRASS MIXTURE.—I noticed Gardener Woolson, of Central Park, had been seeding down some fresh patches of lawn, and I asked him what was the famous Central Park formula. "We use red top and blue grass and a little white clover, nothing more," he said. Why, that's what most everybody uses. For finely kept small lawns and croquet and tennis lawns, however, I would omit the clover. The not uncommon practice of sowing some oats, rye grass or other vigorous grass among the finer grasses in order to give shade till the blue or red top grasses get good hold is of no benefit whatever to the lawn grass, but on the contrary, a serious injury.

COREOPSIS LANCEOLATA.—A most noticeable thing about this plant with me this year is the fewness of self-sown seedlings that have come up about the old plants. In former years the ground in spring in the neighborhood of our large plants used to be as thickly studded with self-sown young seedlings as an old garden patch would be with chickweed in April, but this season only an odd one here and there has come up. This is probably due to abortive seed caused by the prevailing wet weather of last summer.

CHRYSANTHEMUM SEGETUM GRANDIFLORUM, a fine flowered form of the European corn marigold was sent out as a novelty a few years ago, and in fact it was high priced, illustrated and loudly boomed in Europe as well as here. Of course we invested, and for our pains have succeeded in adding another pernicious weed to our grounds, where it has naturalized itself with great freedom.

ANNUAL POPPIES have behaved about the same way, only worse, for they occur everywhere from the cultivated beds and grass lawns to the rubbish pile and manure heaps. But as they are so brilliant and beautiful from the 20th of May till the 4th of July I don't mind them much, and if warred against they are easily overcome.

A GRASS-EDGING MACHINE.—Such an implement would be a God-send to every jobbing florist, practical gardener and amateur who wishes to keep his garden in good trim. The edging shears are an excellent implement, but as we have advanced from scythes to mowing machines in mowing lawns, so should we advance from hand shears to an edging machine for trimming the grass edgings. The machine wanted is one that will crop the grass off close up against the sod and do the work clean, thoroughly and speedily. Never mind extra attachments as hoes or rakes, first of all let us have an efficient grass clipper. There may be lots of them in the market, but what I want is one that will do as good work as the shears and keep on doing it, and at machine rate.

HEMEROCALLIS DIMORPHICA.—This species comes into bloom about Decoration Day, and as it is a neat grower, hardy and copious, it is well worth growing for its early blossoms.

THE WEATHER PLANT.—During the last two years Joseph F. Nowack, the Austrian chemist, set us all agog about the wonderful prognosticating powers of this tropical vine (*Abrus precatorius*), and it took the *Kew Bulletin* of last January to open our eyes to the illusion. No matter, we had got to have some weather plants, and the only feasible means of getting them was from seed, so a couple of months ago I got some seed, parboiled it and then sowed it, but so far not one has germinated, still they are perfectly sound and as hard as pens of iron. Any one, however, accustomed to raising leguminous trees from seed will not despair for a couple of years yet.

AMARYLLISES are growing in favor, and as cut flowers in private families they are taking a firm hold. I know of instances in New York where two or three years ago amaryllis blossoms were regarded as coarse-appearing undesirable flowers, but where they now are esteemed as choice desiderata, and the cry is "get more of them." Empress of India, anica and all bright colored, substantial, bold flowers are the ones preferred. But I do not think our people will pay from \$5 to \$20 a bulb for them, as is common in Europe, no matter how choice they may be; popular prices for popular plants is what we want.

HARDY AZALEAS.—We have a belt of 125 plants of *Azalea amena*, a solid hedge 2 to 4 feet wide by 2 to 3 feet high, and just now (between the 10th and 20th of May) it is a solid mass of bright carmine, fuller and brighter than we ever find it in greenhouse grown specimens, and here the plants are perfectly hardy. As an outdoor shrub or indoor pot plant it is magnificent, but for cut flowers I don't like the color. *Azalea obtusa*, another kind of the same type as *amena*, is

also now in bloom and a solid mass of fiery red—the brightest and most effective color among all our hardy azaleas. A superb dwarf shrub, and the color of its blossoms is quite desirable among cut flowers. The mollis azaleas, from pale to intense flame color, and also yellow and yellowish white are likewise in fine bloom, and the Ghent azaleas in many varieties are beginning to unfold their flower buds. *Azalea Indica alba* was so prominently in bud last March that we expected some flowers would have opened long before now, but so far, although the bushes are nearly white with buds, not a blossom has opened.

RHODODENDRON VASEYI.—To ordinary observers who look upon rhododendrons as evergreen shrubs like *R. maximum* this is not a rhododendron at all, but a deciduous azalea. It is true, however, that this species, its near relative, *Rhodora*, and Ghent and other deciduous azaleas are now embraced in the genus rhododendron. It is indigenous to the mountains of North Carolina, and although it grows there abundantly in Jackson and Monroe counties it was only first discovered in 1878. As a garden plant it is one of the loveliest shrubs that have ever been introduced to cultivation, and is perfectly hardy here with us. It comes into bloom about the first of May, lasts in good flower till the 20th, and its blossoms are pretty large and showy and of the most delightful bright, clear pink color. The plants are easily transplanted, bloom when only a foot high, and grow freely, but I am inclined to believe they like moist ground. They thrive better with us than does *calendulacea* and are harder, but not any better than nor have they shown as broad and bushy a habit as has their companion-at-home, *Azalea arborescens*.

Eichhornia (Pontederia) Crassipes Majus.

Eichhornia (Pontederia) crassipes majus is a most interesting aquatic plant; and when better known, one that will be largely cultivated as a house, or summer decorative plant for garden or lawn. It is of the easiest cultivation; a shallow tub or pan—which may be sunk in the ground—with two or three inches of rich compost covered by an inch or two of water being all that is needed to keep up a fine show of flowers for months; for although a floating plant, it grows much more vigorously if the water is shallow and the roots are allowed to grow into the soil.

The leaves are orbicular, with short inflated stems which give it a curious appearance. The flower which is about two inches across is of a lilac purple shade, the upper petal the largest, with a pear-shaped blotch of blue, in the center of which there is a spot of bright yellow; the flowers are borne on spikes nearly a foot in height; and although they are of short duration, such is the plant's freedom in blooming that a good mass will give a fine show of bloom the whole season.

Increased in same manner as houseleek, and spreads on surface of the water; it may also be propagated from seeds, the seedlings when young, appearing like those of the common cuttail (*Typha latifolia*). Its common name is Water Hyacinth. Native of South America.

Malden, Mass.

BENJ. GREY.

Water Lilies From Seed.

Seeds of *Nymphaea Zanzibarensis azurea* planted October 10, 1889; one seed in a 2½-inch pot and placed in a pan with

EICHHORNIA (PONTERIA) CRASSIPES.

water standing two inches over them, germinated in about two weeks at the greenhouses of Mrs. S. P. Gardner, Hinsdale, Ill. After growing about six weeks in the pan they were transferred to 4-inch

pots, the water still kept about two inches over the rim of the pots, where they grew so rapidly that in four weeks more they were repotted into 7-inch pots and placed in half barrels (five pots in

each) with about nine inches of water over them. The water was warmed daily by displacing a portion and adding hot. The plants grew fast and began flowering in March.

Pinching Back Carnations.

When should carnations be pinched the last time so that they bloom by December 1? is the question asked by F. J. Ulbricht, of Anniston, Alabama; a question which will doubtless admit of almost as many different replies as there are carnation growers, and varieties grown, as circumstances of location, heat, drought and moisture and other important conditions of temperature all exert a greater or less influence over this feature of carnation culture.

Varieties also differ greatly in their time of starting afresh after being stopped; to illustrate this point let us take as an example a patch of half an acre containing twenty of the most popular and usually grown varieties of carnations, let them be as near uniform in strength, size and general appearance as possible, and the treatment of all precisely the same, then let the whole batch be evenly stopped on the first day, or first two or three days of August, and it will be found that some sorts, notably Grace Wilder and Portia, will have perfected a new growth and be in flower long before some others have made even a respectable start towards flowering.

The two varieties named if stopped at the time mentioned can generally be depended upon to produce a full crop of bloom in October and again during the holidays, causing perhaps a brief gap in November, while May Queen, Florence, Hinz's White and some others will be from three weeks to a month later in coming into flower. Buttercup, Tidal Wave, Pride of Kennett and other strong growers of the same general character, under exactly the same treatment, will be at least a month and more likely six weeks behind the first two before producing anything like a full crop of flowers; and I have found Garfield still more tardy in flowering, being even as late as middle of January before making any considerable show of flowers, and for this reason this variety got its walking ticket from my domain, being found unprofitable on that account, although in other respects a magnificent variety.

The above experiences are merely given to show the differences between some varieties that I happen to be familiar with. Doubtless other growers have noted still greater variations among sorts, the peculiarities of which they have had opportunities to study. In consideration therefore of the differences existing between varieties, to say nothing of ever varying local conditions, it becomes a somewhat difficult task to even suggest a rule which might be accepted as broad enough and general enough to embrace a territory so diversified and extended as exists between this point and the home of Mr. Ulbricht in Alabama.

In this section, however, and in the vicinity of New York generally I believe it is considered moderately good practice to stop carnations about first of August when the object is October and November flowers, but from first to middle of September when December and the holiday trade are the main features. My practice for the past few years has been to stop all my carnations about the first of

August, in which case I derive full benefit of the successional flowering of both early and late sorts, the bulk of them coming in when chrysanthemums are tapering off towards their last.

H. E. CURTIS.

Paterson, N. J., May 9, 1890.

Desirable Ferns.

Ferns are justly celebrated for their wondrous beauty of foliage and wherever they are seen in good condition they are deservedly admired by all classes and especially so by the practical gardener. They do not receive the attention by gardeners and florists that their merit as decorative plants, their gracefulness of contour and foliage, and their easy culture deserve. The usefulness of the fern as a decorative plant for the embellishment of the greenhouse or for room decoration far exceeds that of a majority of plants used for such purposes. They undoubtedly must be handled a little more carefully than palms and such plants, but with proper care in watering before taking them out, they can be used a number of times without material damage to the plants. A few species herein enumerated can be easily and rapidly grown and will amply repay for the room they occupy, and the trouble of growing them.

Adiantum Farleyense is unquestionably the gem of the adiantum family and is so easily and rapidly grown to large dimensions that I will designate it the giant of the family. I have repeatedly grown this variety from an ordinary plant in a 10-inch pot to a specimen four feet in diameter in one summer. The illustration is from a photograph of a plant that measures at the present time four feet six inches in diameter and is perfectly and equally furnished all around. The requisites necessary to success are a good fibrous loam with plenty of well rotted manure, ample drainage and an abundance of water when growing, and never in any case to let it get dry. I invariably use this soil for all adiantums with the exception of those with rhizomes which require a more open, porous material. I find with the above treatment I can get larger fronds and larger and finer pinnae than when grown in peat or any admixture of it.

Adiantum concinnum and *A. c. latum* are both robust easy growing ferns, *A. c. latum* has a graceful drooping habit and rather larger pinnae than *concinnum* and makes a larger specimen.

Davallia Mooreana is a very robust grower, the fronds often attaining the length of four and five feet. It makes a magnificent specimen and grows best in a pan in partially rotten sphagnum.

Goniophlebium subariculatum as a basket fern cannot be surpassed. The long pinnatifid fronds attain the length of six feet and droop down around the basket in a very charming and graceful manner. Sphagnum with some lumps of fibrous peat is a good substance for this fern to grow in.

Nephrodium immersum cristata makes a handsome compact plant of two feet or more. The pinnae are regularly and beautifully crested along the edge of the fronds which arch gracefully, and make a unique and pretty plant.

Microlepia hirta cristata is also a gem among the crested ferns. It grows to an immense size, has a peculiar light green tint not usual among ferns, but unfortunately is of little use outside of a greenhouse as the great length and weight of its plume fronds are apt to break or bend them when moved about much. From a very small plant of this variety I

grew a specimen in eighteen months that measured seven feet in diameter.

Lastrea villosa is a grand fern where light, airy effects are desired. It produces fronds more sparsely than any of the above varieties and has long scaly stipules surmounted with beautiful tripinnate fronds.

Nephrolepis davallioides furcata, this is perhaps one of the most useful ferns for decorative purposes. It has the merit of retaining its fronds for a long time and is of a hard and robust nature and withal so graceful, bending away from the common center in all directions, as to command admiration wherever seen.

The list of desirable ferns might be extended to large dimensions, but the student of this beautiful class of plants will readily find out the varieties most suitable to his purpose. Where ferns are required in large quantities, and in a small state, they are better grown from spores than from divisions of the plant, except in the case of those that are slow to produce plants from spores; where such is the case and when it is practicable, divisions are preferable.

Fairfield, Conn. JOHN DALLAS.

New York Notes and Comments.

A recent introduction in the line of pansies is the Giant strain grown by Mr. Zirngiebel in Massachusetts. They are of French origin, and in addition to their large size they are remarkable for the unusual brilliancy of their colors. Many of the tints are really unique, bordering more on the velvety red seen in calceolarias than the ordinary pansy tints. Every shade of purple and lavender is seen, frequently shaded in such a way as to appear as if fringed. Many of the colors could only be described by a milliner; they are the odd shades of old pink, old rose, mahogany and heliotrope seen in fashionable fabrics. The yellow flowers are also very distinct; in fact, all the flowers are noticeable for the beauty of coloring. They all come with very long firm stems, making the flowers more valuable for cutting. Mr. Zirngiebel says that they are rather more impatient of extremes in temperature than the common strains, but their superior beauty fully repays the extra trouble involved. Pansies are always popular and salable, and it seems probable that this fine strain will be fully appreciated by the trade.

A recent visit to Short Hills showed that a good many interesting orchids are in bloom at this time, including some fine cypripediums. One of the rarest of this family now in flower is *C. Schomburgkianum*, now being flowered for the first time in this country. It is rather delicate in coloring, the most marked tint being the warm golden green of the pouch. *Cypripedium Dayanum*, still in flower, attracted notice, so did fine blooms of *C. atropurpureum*. *C. Druryi* was another handsome flower, and there were fine varieties of *C. Lawrenceanum*. It is remarkable how many handsome variations of this variety may be found, even in a small batch of plants. Some good forms of *C. bellatulum* were in flower; it seems a pity that nature has given this flower such a short stem, making it literally useless for cutting, as its oddity proves a great attraction. A pot of *C. niveum* attracted attention by the extreme whiteness of its flowers; it was a very good variety, formerly grown by Mr. Bennett, of Flatbush.

Out at Short Hills they have a model house for odontoglosses, masdevallias, and all orchids needing cool temperature during the summer; it is built with every

SPECIMEN ADIANTUM FARLEYENSE

facility for keeping cool. Here some very interesting masdevallias were seen, particularly fine specimens of *M. Harryana*. Almost every plant showed some distinction in color, all the brilliant aniline shades of magenta and solferino red, which can be compared to nothing but tints seen in single dahlias. Bright flame color was displayed by the flowers of *M. ignea*, and the batch of plants gave a very showy effect. But undoubtedly the oddest of the family is *M. Chimera*, which always suggests a miniature combination of the cuttle-fish and tarantula, hairy, straggling and strange in color. It is not what the average flower lover would call beautiful by any means. *Odontoglossum crispum* was beautiful as ever; some very excellent varieties were in flower.

It would appear that cypripediums are a success, as another house is to be filled with them. A number of big tree ferns were having the trunks covered with close masses of *Ladla albidia*, which would have a good effect when in flower. These tree ferns were planted in large tubs of excellent construction. They were made of cedar, not heavy wood, but strengthened by iron braces inside and iron binding up the corners. A very excellent thing, which will be appreciated by those who have to move heavy plants, was the size of the handles, also of iron; they were large enough to be conveniently grasped by both hands at once. These tubs were really nice looking, being

left the natural color of the cedar, and were both light and strong.

Among the ferns were two recent aspidiums from Japan. *A. viridescens* and *A. amabile* both are handsome; the latter, which rather suggests a pteris in shape, has shining rich green leaves, very hard and firm, its habit is graceful, and its hardness would make it appear very promising for trade purposes. *Adiantum monochlamys* is another beautiful fern, having delicate pinnae notched along the edge; though delicate looking it seems as strong as the *adiantum*s generally used, and has a good habit.

Here, as in many places, the chrysanthemums were planted in boxes for convenience in moving, it avoids a great deal of extra work when bringing inside in autumn. The boxes outside were stood up on flower pots, this prevented the possibility of worms or other pests getting in from the ground, and also gives drainage when there is continued wet, such as last season.

In a cactus bed outside was a queer little succulent, a sort of relation of the crassulas, which Mr. Mauda used as a paper weight all winter, under the impression that it was too wrinkled and dried up to be alive. But it is, and appears to be doing well; this may be recommended to amateurs who complain that their plants always die.

The nursery of hardy stuff is becoming an important feature at Short Hills; among showy plants in bloom were

various phloxes, dodocatheon, iberis, various myosotis and many others. The ground is so advantageous naturally that almost every aspect can be obtained, and it also has an adjacent brook, terminating in a pond, which will be stocked with hardy aquatics. A number of frames contained native orchids; two small but lovely varieties in flower were *Cypripedium arietinum* and *C. montanum*. A little later a large quantity of irises will make a fine show.

Some nicely marked mimulus were in a frame; one would think that this would be a salable pot plant for the retail trade. Interest appears to be growing in the direction of showy herbaceous stuff; a wise selection in this line will add to the beauty of suburban gardens, with comparatively small expense.

EMILY LOUISE TAPLIN.

The Germination of Seed.

We know that seeds germinate, but how many of us can tell how long it takes for a particular variety of seed to germinate. Of course all are able to guess somewhere near the time it takes, but with no degree of certainty. Now why not keep a record of these things as they occur and compare them from year to year, or with one another, so as to get more closely to something like a definite time of germination of some of the varieties sown.

A record of this kind would take but

little time to compile and be of considerable value, not only to yourself but to others. You could do it something after this fashion. April 3, 1890, sowed one ounce of "Acme" tomato seed in flats in greenhouse. Used sandy loam. April 10, seed sown the 3rd is coming up. April 22, potted in 2½-inch pots tomato plants from seed sown the 3rd. It would be a good plan to add where the seed was obtained and the number of plants potted or pricked off.

In the case of flower seed sown for cut flowers the record could be continued to show when the first blooms were cut and how long they lasted in bloom, thereby giving a record of considerable value in successive sowings. If the seed was sown in open border, frame or hotbed, or the plants were transplanted or grown in either, it should appear on the record. Then remarks as to growth and general results could follow. Such a record would be of more value than the amount of time spent in keeping, as it would give something definite to refer to.

By comparing the records of several persons or years you would be able to get something more than guess work in these things, and it will give us something that we are all interested to know about, beside tending to break down the barrier of uncertainty in such affairs that they are now covered by.

ALFRED B. COVELAND.

Springfield, Mass.

Seasonable Notes.

Standards require now to have every attention so as to insure even heads when in flower. The actual height of clear stems should be determined before taking out the tops to begin the formation of the heads. As a rule I think standards are too long on their stems; a clear stem of two feet six inches from the top of the pot will give a stature of over 4 feet when in flower, and this is high enough except for special purposes. It will be well to take off a few of the lower mature leaves and as soon as the desired height is obtained. I have just begun to pinch out the tops and to encourage as many breaks as possible. At the end of two weeks select three, four or five, then pinch out all below. The selected breaks should be again stopped as soon as they have made three or more leaves. The shape of the plants should be determined when the second stop is made, and where they are to be severely trained, the hoops and supports should be placed to begin with. Do not hurry to get plants into their flowering pots, a great many plants become starved through doing so.

Specimen bush plants must have all the attention necessary both in training and stopping. Watering and syringing on excessively dry days will become quite a task. In stopping use judgment; the close habited, short jointed varieties should be allowed to grow longer than those with long joints and lax growth. The actual foundation of all specimens should be laid by the first of July.

Plants grown for specimen cut flowers

should have about the same treatment as standards where there is room for housing tall plants. It has been demonstrated that very strong cuttings, quickly rooted in June, of many varieties, give equally as good flowers as do those plants which have been growing since early spring.

For market cut flowers cuttings may be put in as late as the middle of July, and small plants for pots of from 5 to 8-inches in diameter make even better plants, especially if three plants are put together in 8-inch pots. At the final potting, at the end of August, the plants then have healthy foliage to the pot rims; the plants are dwarfier and give more satisfaction. There are some varieties that should never be grown out of doors. Notably Mrs. A. Hardy, E. H. Fidler, Thomas Cartledge and Mrs. W. K. Harris.

JOHN THORPE.

The Weather Plant (*Abrus precatorius*.)

This is a slender climbing tropical vine belonging to the pea family of plants. It has acacia-like, pinnate leaves and little clusters of purple flowers. Its small, scarlet, pea-like seed which are tipped with black are called crab's eyes or Pater-noster peas, and are well known to visitors to the East Indies, the West Indies, the Mediterranean and other warm regions where the plant is a native or naturalized weed, and where the seed are very plentiful and gathered and made into necklaces and other ornaments.

During the past two years this plant has caused considerable agitation in Europe in botanical and meteorological circles, and all on account of Mr. Joseph F. Nowack, an Austrian chemist who made up his mind to make some money by it. He has been growing the plant for about four years.

The leaves and leaflets of this abrus are very sensitive to light, moisture and temperature, and display their sensitiveness in very marked movements; they also, like those of many other leguminous plants, go to sleep at night.

Nowack became very much interested in these movements, and it didn't take him long to come to the conclusion that they were caused by the condition of the weather at some future period. But as the leaves displayed many kinds of movements and we get many kinds of weather, of course he had got to systematize his notions and fix upon particular movements for different kinds of weather. That didn't take him long, however, and the poor little plants were booked to foretell the weather 48 hours ahead, and this they did "with marvelous precision." They prognosticated fair, bright, dull, showery, wet, changeable, calm, breezy, very windy and hot or cold weather, and told where these special kinds of weather should take place, whether in the immediate locality or 5, 10 or 50 miles away. It also forewarned us of snow or hail, fog or mist, electrical disturbance of the atmosphere, thunder storms, cyclones, explosions in mines, and other wonderful things, and indicated the very directions in which all these changes or events would occur.

A glorious discovery, and so much for science. But where's the money coming from? The discovery must be cornered somehow, then boomed from pole to pole. But how? Well, the abrus is a tropical plant and can not be successfully cultivated except in a warm temperature, and glass houses in which to cherish it were none too common, so Mr. Nowack and Ernst Bahlsen, a market gardener of Prag, got up and patented a sort of

glass case or apparatus in which the weather plant could only be "grown and cultivated" successfully, and when so grown only was it of any avail whatever in prophesying the weather. And the price of these cases was \$25, \$60 or \$250 each according to how elaborate a one you wanted. Ah, this looks like business, now let's boom the thing.

Scientists and reporters were attracted to the scene, the newspapers were full of it, sensational stories regarding the wonderful weather plant set the atmosphere aflame between Berlin, Vienna and London, royalty became interested in the phenomenon, fashion smiled, science inclined and prosperity dawned upon the discoverer. For who could gainsay it? There was the plant well known to botanists and no one could look upon it without beholding the movements, so sensitive are the leaves, and as the witness wouldn't care to wait there 48 hours at a time to affirm or deny its infallibility, it became accepted gospel.

And we are told of an observatory in the Styrian Alps that threw away aneroid and barometer and depended upon the weather plant alone for its weather reports. That farmers, agricultural unions and whole townships in Austria had endorsed it. That the committee at the Jubilee exhibition in Vienna had found it to indicate the coming weather precisely 96 times out of 100. And that Nowack himself had made over 34,000 careful experiments with hundreds of plants, and found it almost infallible. And so on.

The late Crown Prince Rudolph of Austria became interested in Nowack's weather plant and brought it to the notice of the Prince of Wales. Then Nowack invaded England, and through the interposition of the Prince of Wales was given facilities at Kew for carrying on experiments there long enough to convince the sceptical English that the weather plant grown in his patented apparatus and according to his directions was exactly as he represented it to be. So he brought over some of his own plants and his own apparatus, and he himself conducted the experiments. These and the observations made were watched and recorded by Dr. Francis Oliver, lecturer on botany at University College, London, and one of the most eminent of modern scientists. Observations were taken about eight times a day for 23 days in October, and the Kew *Bulletin* of last January was wholly devoted to the matter. Alas for poor Nowack, Dr. Oliver found that the movements of the weather plant were not governed in the least degree by the weather of a future period, near or remote, and that it had no prognosticating power of any kind whatever. Further, that Nowack himself was much befuddled in his computations, some days the prognostications would be for one day ahead, on others for two, three or four as the case might be, and then only decided after the days had passed and the actual weather been recorded; and even then no patent medicine almanac in the country could prophesy the weather a year ahead with less exactness.

But now a Yankee florist appears upon the scene and reaps the shickels that Nowack failed to find. The florist nosing around the world for something new struck Nowack's thunder, and at once perceived a splendid opportunity for a sensational novelty. And he quietly secured a quantity of seed and now, making the most of the notoriety already given to it, he booms the plant both here and abroad, but in a popular way.

COCOS AUSTRALIS.

Nowack appealed to one person in a million, but the Yankee to the multitude; for a quarter of a dollar he will furnish seeds of this wonderful weather plant and you can raise the plants yourself and thus secure a living and everlasting thermometer and barometer. In justice, however, let us say that before the appearance of the *Kew Bulletin* last January not one authentic word had been given to the public derogatory of the virtues of this weather plant.

WM. FALCONER.

Cocos Australis.

The illustration is from a photograph of a specimen in the garden of Mr. J. Fonta, proprietor of the Bloomingdale Nursery, New Orleans, La. The specimen shown was raised from seed by Mr. Fonta and is now sixteen years old and 22 feet high.

Marketing Cut Flowers.

The question of how to market cut flowers to the best advantage is one of direct financial interest to every grower and naturally much interest is manifested in a discussion of methods which promise to better existing conditions. From the numerous complaints made it is fair to assume that there is considerable room for improvement, and this improvement we must seek by adopting better methods of distributing the flowers to the places where there is a demand.

The growers in the vicinity of Baltimore have, I believe, partly solved the problem through the establishment of a Florists' Exchange, which has been in operation since December 1, 1889, and which is centrally located in that city. The Ex-

change is an offshoot from the Gardeners' Club of Baltimore, and has been of great value to both growers and retailers.

It is managed as follows: All florists are eligible to membership in the Exchange on subscribing to at least one share of the capital stock, the price of which is \$5, none being allowed to hold more than three shares. Each member has the privilege of selling his flowers through the Exchange, and this privilege is accorded to members only. A commission of 10 per cent is charged upon sales, which defrays the expense of conducting the Exchange, any surplus being paid to stockholders as dividends at the end of the year. All cut flowers are classified as to quality into firsts, seconds and culls. Each consignor's stock is kept separate and each shipper has a separate book in which every shipment is recorded as received and sale entered as made. Prices are regulated by the law of supply and demand and the working of the whole system has given general satisfaction. The Exchange is controlled by seven directors, who compose the board of managers, the same are elected annually. The president, vice-president, secretary and treasurer are elected by the directors from among themselves. A competent manager has the Exchange in hand, who gives accounts of sales to the secretary daily. Weekly returns are made to the growers, as the Exchange is conducted upon a cash system.

Why can not the florists of America establish a National Florists' Exchange with branches in every large city in the Union? In this age of organization nothing is impossible. Each local Exchange to have its home managers to work in

unison with those of the National Exchange. The supply could certainly be more readily and equably distributed to the points where there was at the moment demand for it. I do not see why such a National Exchange could not be organized on the same principle as the one we have in Baltimore, which has duly been incorporated under the laws of the state. How such an exchange would affect the commission man I do not know, but one thing is certain, the growers of cut flowers would know how they stand; they will know if there is or is not any over-production, and they will know whether they are dealt with fairly, as they will manage their own market.

In conclusion, I hope that the suggestion of a National Exchange will be acted upon in the near future, so that we may soon be able to participate in the great benefits to be derived from such an institution. I hope at an early day to stand in the Baltimore Exchange and know not only the morning's receipts of flowers and the ruling rates for the same in Baltimore, but what the receipts have been and what the ruling rates are on the same day in every large city in the land.

EDWIN A. SEIDEWITZ.

Annapolis, Md.

Technical Education for Gardeners.

In your issue of March 15 I read with very great pleasure a paper on the above subject, by Professor B. M. Watson. There are many practical suggestions in it, and some of great importance to the coming youth who aspires to the gardening profession. It is all very well to write elaborate articles in trade papers, but how is this valuable information to reach the masses. The professor in speaking of American school education for gardeners, instances the fact that many on graduating take to other professions, viz.: teachers, doctors or ministers. Now what is the reason of this? Simply because they can have a good time, be thought more of in society circles, get better remuneration and a more certain means of making an independence. Under these circumstances what inducements are there for a youth to bore his brains with a technical education for so poor a prospect? There are several ways to meet this difficulty. The most important is to make the profession worth the study, and to do so nurserymen, seedsmen and florists must give a more remunerative and uniform wage for skilled labor, with certain privileges on business success. Employ those only (so far as practicable) who make a business of gardening, in preference to the all-round man who is willing to work at anything and for any wages, so he can put in a few months till he can suit himself with employment in the woods, or some better paid work than gardening. These are the men that keep down the wages, do a great deal of damage to florists' stock (by their ignorance) and retard gardening as a profession. Hundreds of practical men are obliged to work for only half what they are through their ability worth. And many gardeners I have met, both in the east and the west, agree that gardeners and florists are the poorest paid of any class. Take any garden paper and read the advertisements; you will see many who want practical gardeners and florists with every accomplishment required in the business, with good character and long experience, and when an answer is received you may get an offer of \$25 per month. You are not chosen by the ability you possess or technical knowledge you

have, but by the low wages you will work for. Mere machines, to be used up to make room for more cheap and raw material. How then is it to be expected that gardening will progress under such conditions? I think I hear you say "supply and demand will regulate wages," so it will, if we do not want to elevate our profession let us drop all technical and educational questions and suggestions and let gardening sink to its former depths, among the swamps of the past, and rise only to "water mark."

An Open Letter to Mr. C. B. Whitnall.

SIR:—It seems that you are the third individual who, in base ball parlance, has put himself in the "pitcher's box" with the very plain intention of "striking us out." You will observe we are still "at the bat." As to the real issue in this controversy whether we "renamed" or attempted to "rename" the chrysanthemum, Mrs. Hardy, all we have to say at this time you will find in my reply to Mr. John N. May. You, Mr. Whitnall, have brought little that is new to the "ventilation" of this matter, but lest you should feel that you had been overlooked, I will try and show you that however "much Mr. May knows about our business," you at any rate have weakened rather than strengthened the cause of the professed and professional reformers. You say: "I suppose likely that putting the name Mrs. A. Hardy in small type on the same page makes P. H. & Co. legally safe, but if their safety is in proportion to the size of the type, they are not very safe." If I should call you a thief, Mr. Whitnall, in type one third the size of that with which was printed Mrs. Alpheus Hardy on page 115 of our catalogue, a page that seems to be your special grievance, I am afraid that you would see it so quickly that within a week I would find myself a defendant in a suit for libel. You must indeed hold a very poor opinion of the intelligence of the American people, if you suppose that out of the thousands of retail orders that we filled this spring of this variety that the purchasers were unaware that its name was Mrs. Alpheus Hardy. As a matter of fact, we have heard from only two parties, who seemed to have been misled by our advertisement. Had our prefix "Ostrich Plume" deceived the public we would have been swamped with complaints. And equally improbable is the assertion of yourself and the

Arkansas Traveler (who pioneered the attack, but who seems to have been lost sight of in the general melee) that our use of the expression "Ostrich Plume" had shortened your sales of Mrs. Hardy. On the contrary, the boom we gave it helped not only your sales but those of other florists who had the variety. Listen if you will for the reason. Peter Henderson & Co. spent in advertising the Ostrich Plume chrysanthemum, Mrs. Hardy, this season in magazines and papers alone nearly \$7,000. If the prefix "Ostrich Plume" had not occurred to us, we would not have risked \$70 on the venture. Bear in mind, Mr. Whitnall, that this \$7,000 was independent of and additional to all catalogue advertising. After the advertisement was fairly running the orders were comparatively so light that we thought for some time we had blundered badly in making it a leader. After a while our turn came and now that the season is practically over, we are satisfied with the results. The reason our widespread advertising did not draw at the beginning was that the amateur buyers went first of all to their local florists and it was only when that supply was exhausted that the bulk of the orders were turned in our direction. So you see, Mr. Whitnall, that "wonderful proficient advertisers" sometimes make serious mistakes. We don't complain of this, we simply state the fact. That others benefited at our expense we alone are to blame.

And now Mr. Editor, a word with you, this controversy was not inaugurated by us, and what share we have had in it has been only to repel attacks, as malicious as they were untrue. Your readers we know must have already had a surfeit of this subject, and no matter who the next "ventilator" may be we shall not ask the use of your columns to reply.

ALFRED HENDERSON.

New York, May 21, 1890.

Insecticides.

We extract the following from an article prepared by Prof. F. M. Webster and which appeared in the Indiana Horticultural report for 1889:

The liquids and substances used in destroying insects may be divided into three classes. (1) Such as require to be taken into the system with the food, and which contain more or less arsenic. (2) Such as have an effect external in its character, and do not require to be eaten. (3) Such as are used as repellants.

The first class is composed of Paris green, London purple, and white arsenic. These are deadly poisons, fatal alike to man and animals, as well as insects, and should be used with caution. * * *

The second class of insecticides, or such as kill by contact, and do not require to be eaten, is composed of a considerable number of fluids and substances, the following being those in most general use: Kerosene emulsion, pyrethrum, white hellebore, tobacco, soap-suds, lye, soft soap, road-dust, lime, ashes, coal tar and carbolic acid.

Kerosene Emulsion.—This mixture is one of our most useful insecticides, being perfectly harmless to human life, composed of ingredients found in every household, and withal is very effective. It can be used against nearly all insects which are within its reach and the cost is but a trifle.

There are two ways of preparing the emulsion—one by taking equal parts of kerosene and milk, the other by dissolving one-half pound of whale oil or other

bar soap in one gallon of hot water, and after removing from the vicinity of the fire add one gallon of kerosene. The last formula is the most practical. With the ingredients together in a suitable vessel, detach the spray nozzle from the pump, place the end of the hose in the vessel, and by working the machine draw the mixture out and force it back rapidly until it is of the consistency of thick cream, which may require from five to ten minutes. Having thus made the emulsion, mix it with cold water until it is reduced to the desired strength, say three to five per cent. kerosene. Either of the two kinds of emulsion applied in the form of spray will destroy plant and bark lice, chinch bug, squash bug, and, in fact, nearly all insects which are found in exposed positions. * * *

The third class of insecticides, or repellants, may some of them destroy also, especially when used for fumigation. Some of these are carbon bisulphide, benzine, turpentine, oil of pennyroyal and tobacco.

Carbon Bisulphide.—This is not only a poison, but also an explosive, if brought too near a light or fire and hence must be used with great caution. If poured into holes made in the earth among the roots of plants the fumes will destroy such insects as may be congregated on or about these roots; provided the holes be immediately refilled to prevent the fumes escaping. Confined in tight vessels with seeds infected by insects, like the pea and bean weevils, it will destroy them in the same manner.

Primula Obconica.

After handling *Primula obconica* for several years I was not aware that it was irritating in any way until a lady told me that her hands were stung every time she touched it. But I often have had my hands blistered as if stung with nettles in cutting heliotrope flowers when the hands were hot. The small prickles on the backs of rose leaves blister my hands in the same way. Therefore I think *Primula obconica* has some accomplices in its criminal conduct, but is not so depraved in my eye as the heliotrope and the rose.

JOHN SPALDING.

New London, Conn.

New York.

Mr. Outram, who represents B. S. Williams, of London, England, in this country, sailed for Liverpool by the *Etruria* May 24, after an extensive business trip through the United States and Canada.

At the May meeting of the Florists' Club it was decided to postpone further action connected with the proposed exhibition until it seems advisable to begin definite proceedings. At the same meeting there was an animated discussion on the proposed changes in the plant tariff, which resulted in the passage of a resolution favoring the withdrawal of all tariff on plants and bulbs. While this resolution certainly expresses the opinion of a large number, it can hardly be taken as significant of the entire trade, for it is a subject on which there is much difference of sentiment.

The representatives of the United States Nursery brought back from the Detroit exhibition two handsome gold medals, one presented by the *Detroit Journal*, the other by Wright Kay & Co., well known jewelers of that city. The eastern visitors all express a very warm regard for the City of the Straits and its generous hospitality.

Mr. W. A. Manda will sail for Europe early in the coming summer.

At the present time the city florists find their chief occupation in steamer work, which usually takes the form of baskets or bunches of flowers. This branch of trade was comparatively small a few years ago, but it seems to increase in bulk now each season, and as a rule calls for the best class of flowers. After a week or so of rather dull trade business seems to be looking up a little; there is not an overplus of stuff now in the market, and prices are really good for this time of year.

Plenty of outdoor lily of the valley is in; indoor bulbs are over. For a few days the immense quantity of lilac brought into the city, which was sold about the streets all the way from Central Park to the Battery really affected the florists' trade; all the people who may be called casual flower buyers bought lilacs.

Some of the best pansies to be seen were sent in by Albert Benz; he has some particularly fine dark flowers. Mr. Benz may also be noted as about the only grower who now sends in yellow daisies. These flowers are never high priced, but they are always attractive and find a good many admirers. Many who used to grow them have now given them up, presumably for higher priced flowers.

Just at this season it would seem as if roses were the most popular flowers, as well as the most plentiful. Mr. Brower, whose window usually displays very fine Beauties and La France, gives roses first place, though naturally different people show different taste. Mr. Brower is largely occupied now with his steamer trade.

A recent marriage, where the bridegroom belonged to the firm of Tiffany & Co., is described as an orchid wedding. The bouquets for bride and bridesmaids were made of orchids, and these flowers were also used in the general decorations. The bridesmaids' favors were jeweled orchid flowers, a novelty recently exhibited by Tiffany. One pretty innovation at this wedding was the use of rose buds instead of rice, to throw at the bride when going away. The decoration for this wedding was arranged by Mr. Butler, and possessed some striking features.

Natural prices are not large, but they are good for May. Hybrids are mostly over; they are apt to be very flabby, but some good Baroness have brought from \$15 to \$25 a 100. Very fine Jacqs have been in from Wiegand and Taphu; they vary all the way from \$6 to \$20 a 100. Beauties range from \$10 to \$25 a 100. Bons and Papas \$2; Mermet, Bride, Cnsin and Watteville \$3 to \$5; Hoste \$6; La France \$2 to \$6; Bennett and Albany \$2 to \$5; Carnations \$1.50. Very fine spikes of gladioli are in; these flowers are forced a good deal now, bringing 8 to 15 cents a spike. They are much admired in showy work. Harrisii brings 12 cents and smilax 20 cents. Adiantum hardly ever varies from \$1.50 per 100.

Trade in bedding out seems very good, and local trade around New York is decidedly brisk. Nearly all the retailers in the plant trade say they are kept very busy. In the upper part of New York city a good deal of nice work is to be seen, especially in the way of balcony gardens and window boxes. There is no marked novelty in such arrangements, but the effect is usually good. E. L. T.

Detroit.

The final report of the treasurer of the recent Floral and Musical Festival shows

that the net amount made by and divided among the twenty-three city charities at the festival was the sum of \$18,919.46, an average of \$822.59 for each of the charities.

The amount paid to the florists in premiums (not including specials) was \$1,553, of which J. Breitmeyer & Sons received \$589; Detroit Floral Co. \$254; B. Schroeter \$146; J. F. Sullivan \$122.50; Pitcher & Manda \$100 (and five specials); Holzngle & Noel \$77; A. Ferguson \$68; G. H. Taepke \$56; D. C. Jones \$55; A. Breitmeyer & Sons \$53.50; Charles Warneke \$22; F. W. Lempe \$8; M. Wetterling \$2.

The total attendance during the four days of the festival was over 55,000. The doors had to be closed on three different occasions on account of the crush and at these times thousands were

HENRY BENNETT.

turned away. The management expresses the belief that had the building been adequate the attendance would have reached 75,000, for many were deterred from going by the reports regarding the crowded condition of the building.

Mr. W. Brearley, who so successfully managed the flower show was presented with a handsomely engrossed copy of resolutions and several unique and beautiful testimonials the evening of May 20, by a committee representing about fifty leading citizens and business men who wished to make some public recognition of his services. Mrs. Brearley was also presented with a chaste and unique brooch, being a faithful representation of an orchid in gold and jewels.

Chicago.

H. B. Freeman is the receiver for James King the seedsmen.

Devine's Boiler Works have passed into the hands of Mr. Wells B. Sizer, Mr. Frank Dan Blish who was for twenty-two years attorney for the late Peter Devine, continuing in full charge of the business, and Mr. Arthur Hatfield, for so long foreman remaining as superintendent of construction.

Mrs. J. C. Vaughan and Miss Florence Vaughan have returned from a two-months stay in California.

Messrs. E. G. Hill of Richmond, Ind., and M. A. Hunt of Terre Haute, Ind., were in the city during the past week.

The Florist Club discussed the World's Fair at last meeting. The feeling was general that the club should at once take some action to see that the interests of

the horticultural department did not suffer at the hands of the powers that be, and that ample provision be made for a floral display which should be in keeping with the other details of the great exhibition. A committee, consisting of Messrs. Jas. D. Raynolds, J. C. Vaughan, J. T. Anthony, F. F. Bentley, Geo. Gardner and G. L. Grant, was appointed to represent the club and to take such action as seemed advisable to further the object in view, in addition to securing as far as possible the co-operation of the Florists' Clubs of other cities. A resolution endorsing Mr. James D. Raynolds of Riverside, Ill. for the position of Director of the horticultural department was introduced and unanimously adopted. It was decided that the coming chrysanthemum show should be held November 4 to 7 inclusive. A committee was also appointed to look after railroad arrangements to the Boston convention of the S. A. F. Chicago will probably show up strong at Boston.

The Lincoln Floral Co. is the title on the sign of a new floral store at 141 N. Clark street.

Holland & Barrett are no longer at 263 N. Clark street.

Mr. T. V. Evans, of Riverside, is cutting some very fine Black Hamburg grapes from vines only twelve months old.

At the "adjourned session" of the last Florist Club meeting some very creditable scores were made. Four strikes in succession so excited one player that he was with difficulty restrained from bowling on both alleys at once.

Henry Bennett.

We have pleasure in presenting herewith a portrait of Mr. Henry Bennett, the well known rosarian of Shepperton, England, the raiser of W. F. Bennett, Puritan, Mrs. John Laing, Meteor, Her Majesty, Princess Beatrice and others familiar to American florists.

Mr. Bennett is a typical Englishman and looks to be the very personification of good health. Short in stature, of heavy build, with clear, fresh complexion and bright blue eyes he gives promise of a hale, hearty old age.

He was present at the Chicago convention of the S. A. F., where he was much affected at the hearty welcome given him by the florists of America.

Hartford, Conn.

The Pansy Exhibition of the Hartford County Hort. Society held May 7 attracted large crowds to view the handsome display.

An especially attractive feature was the remarkably handsome exhibits of Denys Zirngiebel, of Needham, Mass., and Albert Benz, of Douglaston, N. Y., who fairly astonished local gardeners with the magnificence of their displays.

The awards were as follows:

Class A—50 cut blooms, 13 entries, 1st, George W. Atwood, 79 points; 2d, John Coombs, 61.

Class B—25 cut blooms, 11 entries, 1st, George W. Atwood, 75 points; 2d, C. W. Francis, 62.

Class C—10 cut blooms, 1st, George W. Atwood, 82 points; 2d, C. H. Pember, 64.

The judges awarded the diploma of the society to Denys Zirngiebel for the finest exhibit in the hall (not entered for competition), and gave "special mention" to Albert Benz for his fine collection of soft colors. They also commended the exhibit of orchids by B. C. Beemer and the cut roses and tulips shown by A. N. Pierson, of Cromwell.

The points in pauses upon which the

blooms were judged are: Substance 40, shape 20, color 20, arrangement 10, size 10; total 100.

The society will give a rose show in June, one for vegetables and plants in September, and one for chrysanthemums in November. A bulb show is in contemplation for next winter.

Seasonable Notes.

Odontoglossums crispum and *Pescatorei* will now have started new growths and will require attention (if not already done). See that they all have proper drainage and ventilation or many new growths will be lost on hot muggy days. If they show signs of improper drainage take them carefully out of pot, remove all sour potting material and put them into clean pots three fourths full of clean broken pots or bricks, but be sure not to give them too large a shift as they do far better in moderate sized pots. As soon as the new growths are showing strong roots at the base increase the watering and when the bulbs are making up their shape copious supplies will be necessary. Never allow the house to become dry and hot; give copious supplies of fresh air, but do not expose them to drafts of cool air which in the summer season means drying up both house and plants. *Odontoglossum grande*, *O. Harryanum* and *O. Insleyi* will take a little stronger heat, light and somewhat drier atmosphere, such as the cattleya or lycaste tribe like.

Laelias anceps, autumnalis, albidia, etc. will now have commenced growth and will require a slight increase of moisture, but do not water too copiously to start with; let the roots be well lengthened and the weather warm before they get heavy waterings, but like the *odontoglossums*, when the bulbs are making up and with plenty of ventilation they can scarcely get too much water night or day until the flower scapes are well developed, then gradually withhold water and after the flower is cut put them away in some convenient place giving enough water only to keep them from over shrivelling. The principal aim when resting is to preserve the last season's roots from decay, which they will surely do if continually watered. Often in collections improperly rested you can not find a living root either in pot, basket or even on blocks. This condition is brought about by keeping the plants when at rest in too warm a house and their being continually watered, say from November to May. I take this to be the primary cause that so many express themselves that the *L. autumnalis* and *albidia* are short lived and hard to keep.

I last year dispensed with the use of sphagnum in potting one half of my *odontoglossums* and other plants, using clean well sifted fern root; the latter I find to be very much the better plan; those will not require anything done to them this season and the plants are stronger, of better quality and much healthier at the roots, while all those on which sphagnum was used as a top dressing last year require a thorough repotting and cleaning. The same is the case with the Mexican orchids such as *Lycaste Skinneri* and such like plants. But for cypripediums I find nothing better than

good clean sphagnum with plenty of drainage, renewing the material whenever it commences to decay.

Utica, N. Y.

WM. MATTHEWS.

Hardy Cypripediums.

Like their tropical congeners among greenhouse plants, so are they the gems of the hardy plants. In the months of May and June they fill the odd nooks of the rockwork, and shady places with their flowers so strange and beautiful.

Cypripedium debile, (syn. *cardiophyllum*). This very rare Japanese species is, I believe, the first time in bloom in America, or in cultivation at all. It sends up a smooth light green stem, 4 to 6 inches in height, which is terminated by two opposite broad and shiny flat leaves. From the center of these leaves on a slender peduncle hangs the flower. The different parts of the flower are well proportioned in size, and measure about an inch in diameter. The dorsal sepal is rather broad, pointed and re-curved at the end as are also the lower sepal and the petals. The three parts of the flower are nearly uniform in size and shape, all having the ends reflexed. The ground color is light green with rich black purple shadings and stripes from the center out. The lip is nearly perfectly round, white shaded pink and marked with deep purple veins. Although not a very showy species it is one of the strangest of all the cypripediums known, the plant without the flowers having the appearance of a germinating lima bean.

Another rather rare and beautiful species is *Cypripedium montanum*, which is much more showy and superior in every way to *C. candidum*. The stems are stouter and higher, carrying from two to five flowers on each, with beautifully twisted petals of dark rich brown, the same color predominating also in the lower and upper sepal, while the lip is white shaded with light pink; the staminate is bright yellow with few red spots which gives the flower a very fine contrast.

Besides these two novelties, I have also before me in flower the rarely seen *C. arietinum*, *C. candidum*, *C. acule*, *C. pubescens*, *C. parviflorum* and the European *C. Calceolus*.

The bright and showy *C. spectabile*, the rare *C. Californicum* and *C. macranthum* of Japan and Siberia are pushing up their growths. These three last named species always come in flower from two to five weeks later than the other species.

A half shady nook planted with hardy cypripediums presents a very pleasing sight, and if planted in well drained ground composed of leaf mould, stiff clay and some peat they will grow and increase in size and beauty every spring. They are all perfectly hardy, and only a light covering of either straw or leaves would benefit them, simply to keep out the sudden changes of thawing and freezing.

W. A. MANDA.

Some Rare Cypripediums at Mr. Kimball's.

Cypripedium Haynaldianum Kimballianum. This is by far the finest variety of that species that has ever come to my notice. The flowers are large, broad and stand out stiff; the dorsal sepal very broad at the top, pure white with deep rosy lines running through. The lower sepal is nearly white shaded with light green. The petals are very broad at the ends, of a rich rosy color, while the inner part is light, yellowish green set with very large and dark spots. It is a very fine acquisition to this numerously repre-

sented genus of plants, and one of which Mr. Kimball is very proud.

The fine *C. Kimballianum* was also in bloom at the same time. The combination of colors is very pleasing, being the nearest approach to *C. Prastans*, *C. lavigatum* and *C. Stonci*.

Another rarity in bloom for the first time in this country was *C. Lawrenceanum* Hyacum. This is the albino among the *Lawrenceanum*, being destitute of any purple or brown which is characteristic to the species. The only color visible in the flower is pure white, which covers nearly the whole area of the dorsal sepal, with light yellowish green veins, while the petals and lip are of a soft greenish yellow color.

Many other rare and choice specimens of cypripediums and other orchids were in bloom at the time, and all the plants looked fine and healthy, which is due to Mr. Geo. Savage's skill and energy.

W. A. MANDA.

Fungous Diseases of Fruit Plants.

The U. S. Department of Agriculture has just issued Bulletin No. 11 of the section of vegetable pathology. This publication, prepared by B. T. Galloway, chief of the section, is a report on the experiments made in 1889 in the treatment of several important plant diseases.

The work was carried on in nine states, embracing nearly every variety of soil and climate and the results as set forth are as a whole highly encouraging, despite the fact that the season was one of the worst ever known for fungous diseases of all kinds. The diseases under treatment were scab, rust and bitter-rot of the apple; powdery mildew, downy mildew, leaf-blight, anthracnose and black rot of the grape; leaf-blight of the pear; leaf-blight, rust and fire-blight of the quince; leaf-blight of the strawberry; rot and blight of the potato, tomato and melon.

Considerable space is devoted to a summary of volunteer reports on vine diseases from which it appears that nearly every one who followed the directions laid down by the department succeeded in saving the greater part of their crop. From all accounts it would seem that the Bordeaux mixture containing 6 pounds of copper and 4 pounds of lime to 22 gallons of water is still the most reliable remedy for grape diseases. The results, however, of the treatment with the ammoniacal carbonate of copper solution are highly encouraging and lead to the belief that in ordinary seasons it will be the cheapest, most desirable and effective remedy. One great advantage it possesses over the Bordeaux mixture is that it does not spot the fruit, which is a matter of importance, especially where the grapes are used for the table. Mr. Galloway suggests that the Bordeaux mixture be used for the first three treatments, after which the ammoniacal solution be substituted for the rest of the season.

Quite Regardless.

"I want a bouquet for a bride to carry. Have it a stunner—I don't care for the cost! There's a two dollar bill for you—now do your prettiest!"

OUR NEW TRADE DIRECTORY is now ready. It gives a complete and accurate list of the florists, nurserymen, and seedsmen of the United States and Canada, designating the special branch of the trade each one is engaged in. Price \$2.

Leaves of Advice From a Limb of the Law.

(For Young Florists.)
XIII.

Please don't flourish that pruning knife quite so close to my head. Why, for a man whose calling is as peaceful and contemplative as a fisherman's, you are terribly excited this morning.

Shameful is it? Well, let's hear something about it. You say old Blowman came around here yesterday and began to abuse you for rendering such a large bill for flowers at the funeral of his wife and accused you of doubling the prices for the very same flowers which you had furnished when his first wife died. Shamed of yourself? Why the old man will hesitate about taking a third partner if you go on raising prices this way.

Put him out of the office did you, and now he threatens to arrest you for assault and battery? Let him come on. The law looks upon a man's honor and dignity with a very jealous eye. While a customer has a legal right to protest against what he deems an overcharge, he must in doing so use respectful language and in particular must he, while on your premises, conduct himself with some show of politeness. Otherwise the law will justify your laying hands upon him and ejecting him from your place of business.

But you must not use any more strength than absolutely necessary. A blow would constitute a battery. You must remove the offender gently and with no outburst of temper. Otherwise in a criminal charge you might be liable to a fine, or in a civil action be adjudged to pay damages. Damages you know are the relief which the law awards upon the violation of a right. They may be merely "nominal," that is say fifty dollars, just enough to carry costs.

Had you for instance struck Blowman while occupied in ejecting him you certainly would have been subjected to a small fine—small because there was gross provocation. The law doesn't expect a man to be a saint and turn one cheek when the other is smitten.

Exemplary damages will be awarded when you can show deliberate and wilful intention to injure. For instance, suppose old Blowman in his anger had come around last night and in some way quenched the fire in your furnace and let your plants freeze, you would be entitled to exemplary damages.

In an action for damages the law will always take into consideration the hurt done to your feelings if any can be proven. But this "mental suffering" must have sufficient basis to enable the court to have a fellow feeling for you. Very few people understand this question of damages. When a man goes into court and asks for damages, he must not base his claim on mere speculation. He must always prove his damages—bear this in mind. The law will not allow him to say: "The breach of that contract caused me a loss of \$1,000." He must prove that such was the case without any "ifs" or "provideds" or "might have beens."

The law will always have sympathy for any man who, upon discovering his wrongful act, at once makes all the reparation possible, strives in every way to undo the wrong, to prove that he had no malice, that it was simply an error of judgment or an oversight.

Of course you will never be allowed to go into court and plead the "baby act," that is admit your wrongful act and claim that you "didn't know that it was loaded" so to speak. It is always better

to stand up like a man and submit to the verdict of the jury with a good grace. You recollect when that Paris green you were using blew over the fence and poisoned Mrs. Finnegan's sow. I told you at once to offer to pay for the litter of young pigs which spite of Mrs. Finnegan's tender nursing died the next day—as well as for the old sow.

To entitle a man to damages he must be able to show that some one is liable. It would be folly for you to sue your landlord for injury done by a thunder bolt. Or suppose your neighbor owns a vicious horse and warns you not to enter the field, you do so at your own risk.

In some contracts it is customary to insert a provision stating what the damages shall be in case of a breach by either party. This is called "liquidated damages." But generally damages must be "measured." The "measure" of damages of course varies in different cases and also whether the case is a suit on a "contract" or an action for a "tort," such as trespassing on a man's property, injuring his property, converting it to your own use, etc., etc. Suppose you discharge an employee without "legal cause" the "measure" of damages would be his wages until his time was up. Should he find employment elsewhere you would be entitled to so much reduction. If a carrier loses your property the "measure" would be its fair value. You would not be allowed to show that you might have made a thousand dollars in case it had arrived safely.

There are cases which require the wisdom of a Solomon to "measure" the damages correctly, such as breach of promise cases, bodily injuries, libel or slander cases, etc. One man sued another for calling him (in German) a "rascal" (Spitzbube), but on the trial of the action it was proved that this word like our expression "little rogue" might really be a term of endearment. Certainly a very ingenious defense.

You ask: "Suppose I sell a man a bill of goods on credit, but afterwards change my mind and refuse to deliver, what would be the 'measure'?" I answer, the difference between the contract price and the price at the time the goods were to be delivered; in other words, the purchaser would be entitled to his profit, with any expenses he could prove. Suppose I had paid you in full and you defaulted? I would be entitled to recover back the purchase money with the margin of profit and all actual costs and expenses. When goods were to be delivered "on or about" a certain day, you would be entitled to a reasonable delay, after which you would be in default.

Yes "contributory negligence" always excuses a person from paying damages. A right to damages for a personal injury does not survive to one's legal representatives. But if in your life time you recover judgment it goes into the inventory of your estate like any other asset.

UNCLE BLACKSTONE.

"Make 'Em Bloom."

A circular advertising a fertilizer with the above convincing title has been sent us. The tale as to the manner in which the manufacturers came into possession of the "secret" formula is told with such artlessness that we print it below:

"Some years ago we had in our employ one of America's best cut flower growers; his success in obtaining bloom from almost any plant under his care was almost a miracle, and especially so in the winter season when all nature is at rest. When ever we became the possessors of any

novelty or new plant our foreman first got them into a good healthy growth, and then they were given to (as the boys called him) "John Bloom" for flowers, and it was not long until we had the pleasure of seeing the novelty put forth its first bloom, which was promptly and closely scrutinized by all of the employees of our establishment from the high-headed ash heaver down to the very docile and modest John Bloom. The gentleman named had for years used a compound of his own mixture which had proven the best of all stimulants for bringing forth flowers from almost all plants on which it was used. Such rose buds, carnations, violets, hyacinths, heliotropes, etc., never came under our observation as he could produce by the use of his secret compound. It was a long time before John would reveal the nature of the compound he used with such wondrous results; but after a good deal of coaxing and a liberal bait of greenbacks, he gave us the recipe for the compound."

Burning the Candle at Both Ends.

I send you a clipping of an adv. that recently appeared in our daily paper. The author of this is a well known wholesale dealer in rooted cuttings of verbenas and celosia, also carnations. He expects the trade to support him during the winter and the way he returns the compliment is by selling bedding plants at retail as follows:

"Assorted flower plants in baskets, 12 plants in each, at 25 cents per basket, and other plants proportionately low, at

the Lake street greenhouses. Call and see for yourself. Verbenas 35 cents per dozen, pansies 35 cents per dozen, and many others at prices equally as low."

In conclusion, allow me to ask the trade, is it for our interest to patronize a man that will sell to the public at retail at a less price than to the trade at wholesale? RETAIL.

Steam Heating.

Will a 4½ H. P. upright steam boiler heat a house 100 feet long by 14 wide and can the boiler be set on top of ground and do the work? If not how deep must it be set? J. C. S.

New York.

Lilium Harrisii After Blooming.

I would like to ask some experienced grower through your columns as to the best way of treating the bulbs of *Lilium Harrisii* after blooming. H. M. H. Ohio.

Carnation Queries.

Is it necessary that carnations be planted over pipes to produce abundance of bloom, or will they bloom without bottom heat? What month and what time of the month is it best to lift them for placing on benches? H. M. H. Ohio.

Shading.

"What is the best shading" is a matter of opinion and circumstance. I regard air-slaked lime mixed with cold water as best on the whole. Cheap, easily applied, does not wash off readily, if it has a day or two of fair weather to set it, (change to carbonate of lime) and is not difficult to remove in the fall. S. F.

A New Violet Discovered.

Under the above caption the Baltimore *Sun* prints the following paragraph recording a most startling discovery which will undoubtedly set the trade agog:

"It is the sweetest flower I ever knew," said Miss Browning, the well known Baltimore florist, displaying a new violet just discovered by Mr. A. P. Gordon Cumming on his place near Sykesville, Md. The foliage leaves of this violet are longer than those of the ordinary wild or cultivated violet. The flower leaves of the new violet are a soft white, striped or mottled with light and dark purple. Unlike the other cultivated violets, the new one is a single violet. All the cultivated violets have hitherto, without exception, been double. Single violets, until this discovery of Mr. Cumming's, have been without perfume, but the Sykesville cultivated single violet has a wealth of rich perfume that can not be surpassed. Those wonderfully sweet plants, daphne, odoro and oleo fragrans, do not give off more delightful odors than this new violet.

A Climber.

It is darkly hinted that one of the novelties to be offered next year by an enterprising advertiser will be "The Fireman Plant, warranted to climb all over the front of a house within three weeks from time of sowing the seed." From the title I am inclined to believe that it will climb the rear wall also and that it won't hesitate to climb down the skylight after it gets on to the roof. G. R. A.

Got into the Wrong Place.

CUSTOMER—"I want a funeral design—a large pillow. Put 'Faith, hope and charity' across the center, 'He is not forgotten' around the edge and 'From a friend' in one corner."

FLORIST—"Peg pardon sir, but you have got into the wrong place. The sign painter's is in the next block."

Bending the Twig.

"My boy, you have been caught in a falsehood. I am deeply grieved at your conduct. Never forget that truth happens in every word and action of an honest boy or man. I hope you will never again permit yourself to either tell or act a lie. Now go back to your work and finish stringing those Duchess of Albany labels on to that lot of La France."

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant ads. not admitted under this head.

SITUATION WANTED—As rose grower and propagator of general florists' stock. Address C. R. care American Florist, Chicago.

SITUATION WANTED—By young man; several years' experience; competent to take charge of small greenhouse or propagating. Good references. Address A. Y. Z., Bridgeton, N. J.

SITUATION WANTED—As gardener by young man who has served an apprenticeship with an English firm, also has experience of 6 years in this country. Testimonials excellent. Single. Wm. Attwood, Andover, Mass.

EMPLOYEES.

Among the many problems which present themselves to the intelligent commercial grower of plants and cut flowers the labor question is probably the most perplexing. Nearly all the work which must be done requires experience and wise discretion upon the part of the one actually engaged in its execution; there are but few items which can be safely entrusted to a common laborer. Furthermore, it is in many cases quite impossible to determine at once how well the work has been done; the results for good or ill may not appear until a considerable time has elapsed. It is this fact that makes it a question of time to demonstrate the competency or incompetency of an employee, and during this period an unskilled man or one lacking conscientiousness in his work may lose for his employer a very considerable amount. This in conjunction with the fact that a man's efficiency is vastly increased through a thorough familiarity with the soil, conditions, etc. at command, makes it doubly desirable to retain so long as possible one who has conclusively shown a reasonable degree of capability.

That the majority of employers lack a proper discrimination between profitable and unprofitable help admits of little doubt. And as a result there are too many men floating around the country who are unfit for anything but a laborer's work, but who are employed in the greenhouses because they will work for low wages, though they frequently prove fearfully expensive labor to those who are unwise enough to employ them. Low wages do not necessarily mean cheap labor in this business; neither do high wages necessarily mean skilled labor. Frequently men of little or no ability have received pay considerably in excess of their real merit, though such instances are much more rare than the reverse.

We must increase the average of capability among journeymen gardeners by discriminating against incompetent men (for they are dear at any price) and encouraging by the prospect of substantial reward those who display ability and zeal. The employer should understand that his labor must earn for his employer a sum sufficient to pay his wages and leave a profit for the man who supplies the opportunity for him to secure a return for his labor. And the wise employer will discover the men whose labor is of a quality which enables him to make a profit upon it and will stimulate them to the exercise of all their skill by increasing their pay in proportion to the results realized. There is no sentimentality in this course, it is simply business. It is not only better for the men but it is better for the employer.

We care nothing for the education a

man may have unless he can manage to make it of benefit in securing better financial returns. In most cases education makes a better man, with a broader mind and in general a more profitable man, but there are those who have a smattering of technical knowledge which is not backed by good common sense, and the result is a theorist who is apt to be more dangerous than one who is densely ignorant. We must take all these things into consideration. In the last few years there has been a noticeable improvement in this as in many other things, and we trust that it is but the beginning of a thoughtful consideration on the part of employers which will ultimately advance the intellectual average of employees to a better and more profitable standard.

ONE OF the grandest results of the annual conventions of the Society of American Florists is the great advance in the direction of good-fellowship and brotherhood. When business rivals meet on such occasions and each discovers what a thoroughly good fellow the other is, they go back to their homes with a better feeling and prepared to conduct their business in a more generous and manly fashion. And a lasting impression for good is always left upon the members of the craft in the cities where these meetings are held. Being constantly brought together to work in unison for a common object—arranging the details for the reception and entertainment of the visitors, brings them into closer relations, making new friendships and cementing old ones. The good accomplished by the National Society can not be measured solely by the amount of practical and valuable information which it disseminates. The good-fellowship which is engendered by its meetings forms no small part of the benefits which accrue directly to those who attend, and indirectly to the entire trade.

THE PREMIUM LIST of the Cincinnati Chrysanthemum Show has been issued. The premiums are very liberal and should call out some lively competition. The offer of \$50 for "Best 6 cut blooms, variety not before disseminated," will undoubtedly appeal strongly to the originators and introducers of new varieties. From the reading of the offer it would seem that the six blooms may be all of one variety. November 11 to 15 inclusive is the time set for the exhibition.

THE MISSOURI STATE Horticultural Society holds its semi-annual meeting at Poplar Bluff, June 3 to 5. The programme is a lengthy one and the list contains essays on nearly every subject of practical interest to horticulturists. Premiums will be awarded for exhibits of cherries, raspberries, strawberries and cut flowers. Reduced rates have been secured from the railroads for those attending the meeting.

THE RUSH of the spring plant trade is here and the florist who grows bedding plants is engaged in his annual attempt to dispose of three day's work in one. May the weather be favorable during the selling season, the demand sufficient to take all the stock grown and prices maintained at profitable figures.

LE JOURNAL DES ORCHIDEES is the title of a new publication devoted to orchids and under the direction of Lucien Linden, at Brussels, Belgium. It is announced as a practical guide to the culture of orchids; it is in the French language. No colored plates are used and the price is but 10 francs a year.

THE New Jersey Floricultural Society has issued a schedule of premiums for its annual chrysanthemum show, to be held at the Park Rink, Orange, N. J., November 4 to 6. Copies of the schedule and entry blanks may be obtained from P. J. Fay, Secretary, Llewellyn Park, Orange, N. J.

THE Society of Indiana Florists has issued an advance list of premiums for its fourth annual chrysanthemum show to be held at Indianapolis November 11 to 15. Copies may be had on application to Wm. G. Bertermann, Secretary, Indianapolis, Ind.

THE Forest City Florists' and Gardeners' Society, London, Ontario, has issued a premium list for its first annual chrysanthemum exhibition to be held November 4 to 6. Copies may be obtained from Wm. Gammage, secretary, London, Ont.

H. E. F. See recipe for kerosene emulsion in another column. The frequency of application should be governed by existing local conditions.

TWENTY-EIGHT PAGES again. The current volume of the FLORIST will show a considerable increase in size over preceding ones.

OUR NEW trade directory is now ready. Price \$2. Order a copy now.

The Seed Trade.

SEED TRADE ASSOCIATION.

H. W. JOHNSON, Philadelphia, president; ALBERT M. McCULLOUGH, Cincinnati, secretary and treasurer. The eighth annual meeting at Saratoga Springs, N. Y., beginning June 10, 1890.

American Seed Trade Association.

SECV'S OFFICE, CINCINNATI, May 24, '90.

Regarding the coming meeting at Saratoga, June 10, I have arranged with the Adelphi Hotel for accommodations and headquarters, special terms to members and their friends at \$3 per day. We have also arranged with the Trunk Line Association and the Central Traffic Association for special rates of one and one third fares for round trip, on the certificate plan, for delegates and friends attending the meeting, covering the territory east of Chicago, Mississippi River and St. Louis, except Michigan and New England.

It is very desirable that we have a full attendance at this meeting as there are quite a number of subjects that will be brought up of vital interest not alone to the members, but to the entire seed trade of the United States. One of the main objects of the association is to develop business relations in which all can stand together in the effort to improve and perfect a standard of business integrity which shall include purity of stocks, honesty of representation, carefulness of obligations and promptness in execution. Now it must not be expected that each and every member can get quick and direct returns from the meeting, but in general results they can not but be benefited. The association has already accomplished considerable for the benefit of the business; but there is much more to be done, and by united action we should have considerable weight that we can not expect to have as individuals. It is earnestly requested that if it is not possible for you to be present you should at least be represented by proxy. ALBERT McCULLOUGH, Sec'y.

ISAAC F. TILLINGHAST, under date of May 20, 1890, sends from La Plume, Pa., a printed circular that he "is in such shape that it is impossible for him to meet his obligations promptly." And June 1 is hardly here yet. J. A. Everitt & Co., of Indianapolis, Ind., ("O. K. seeds") also announce, May 22, that they have stopped payment.

THE Cleveland Seed Company, S. M. Pease general manager; Conrad N. Jordan, president; E. F. C. Young, vice-president; J. D. Bodle, Jr., secretary; R. S. Fowler, treasurer, announce May 12 that they succeed to the business of the A. B. Cleveland Company, limited, and are located at 111 Morris street, Jersey City, N. J.

J. W. MILLER & Co., of Freeport, Ill., nurserymen and seedsmen, announce that they have suspended payment. J. C. Walker, a florist of Nashville, Tenn., is reported to have disappeared.

JOHN LEWIS CHILDS has broken ground for a new fire proof seed house 60x40 feet, four stories, brick and iron, all floors iron and tiling and all strictly fire proof, to cost \$20,000.

C. L. ALLEN has engaged with F. E. McAllister, taking charge of certain departments of his business.

OUR NEW DIRECTORY of the florists, nurserymen and seedsmen of the United States and Canada is now ready. Price \$2.

San Francisco.

The second annual exhibition of the California State Floral Society which opened May 20, was a decided advance on the previous one. Notable among the displays was that of Mr. J. H. Sievers consisting of orchids, tropical plants and cut blooms of his new rose the "Rainbow." Mr. Timothy Hopkins made a beautiful and very extensive exhibit of Sweet Peas, showing thousands of blooms and in great variety.

Premiums were awarded as follows: 24 cut blooms H. P. roses, E. Gill; 12 cut blooms H. P. roses, E. Gill; 24 cut blooms tea roses, California Nursery Co.; 6 cut blooms tea roses, Mrs. R. Townsend; 12 cut blooms climbing roses, Fruitvale Nursery Co.; 6 best climbing roses, Mrs. T. L. Walker; general collection of cut roses, 1st Peter Theisen; 2nd H. T. Greenough; 3d California Nursery Co.; blooms of bulbous plants, Mrs. T. L. Walker; California wild flowers, 1st G. W. Dunn; 2nd Mrs. Vestey; general collection of cut flowers, Mrs. E. T. Crane; pelargoniums, best 12, Mrs. D. R. Harris; rhododendron blooms, California Nursery Co.; camellia blooms, E. Gill; clematis bloom, California Nursery Co.; pansy blooms, 1st Mrs. R. D. Laze; 2nd R. H. McGill; roses in pots, F. A. Miller; flowering plants, Charles Abraham; ferns, Mrs. L. O. Hodgkins; best specimen plant, Mrs. Coupland; most meritorious general exhibit, John H. Sievers.

Special prize—\$25 offered by Emory E. Smith for best collection of tea roses, E. Gill.

The Boston Convention.

Following is a list of Boston hotels at which arrangements have been made for delegates to the coming convention of the Society of American Florists. It is arranged according to distance from the convention hall, beginning with the nearest:

NORTHWARD FROM HORTICULTURAL HALL.

Rooms may be engaged now on application to any member of the committee on hotel accommodation. The committee is as follows: Wm. J. Stewart, 67 Bromfield street, Boston; M. H. Norton, Berkeley street, Boston; P. Welch, 165 Tremont street, Boston; J. Frank Curtis, Newtonville, Mass.; J. J. Cunningham, Readville, Mass.

News Notes.

ORANGE, N. J.—Mr. A. Decker has opened a florist store on Main street.

DRESDEN, GERMANY.—Karl Wilhelm Mietzsch, the well known azalea and rose grower, died April 30.

OAKLAND, CAL.—There was an excellent display at the recent floral festival and the exhibition was well patronized.

SPRINGFIELD, ILL.—Mayor Charles E. Hay, well known to the florist trade of the country, will spend the summer in Europe.

CINCINNATI.—C. A. Peters has sold his business to Ernst Mack, who will continue the same. Mr. Peters is now in Brunswick, Ga.

RICHMOND HILL, N. Y.—Axel Lindstrom is now building a new house 20x100, which will make him a total of 7,500 square feet of glass.

SANTA BARBARA, CAL.—At the last meeting of the Horticultural Society it was proposed to hold a chrysanthemum show in the autumn.

ATLANTA, GA.—The display of roses at the session of the Atlanta Horticultural Society May 17 was unusually good. A rose show is projected for June.

PALATKA, FLA.—In the garden of Mrs. M. E. Boyd, of this city, are over 1,000 bushes of roses in great variety and in spring the garden is literally a sea of bloom.

QUINCY, ILL.—A heavy hail storm smashed 5,000 feet of glass on the greenhouses of G. Gross the evening of May 12. Plants were badly cut up. John A. Heller also lost heavily.

SHORT HILLS, N. J.—Messrs. Pitcher & Manda have enlarged their greenhouses to make room for the magnificent collection of orchids recently purchased from DeWitt Smith, of Lee, Mass.

KANSAS CITY, Mo.—The Woman's Christian Association is making arrangements for a floral festival to be patterned as far as possible after the recent floral and musical festival in Detroit.

SAN DIEGO, CAL.—The net receipts of the annual flower festival amounted to about \$700, which go to the Woman's Home and Day Nursery. Among the exhibits were many elaborate floral designs.

SANTA BARBARA, CAL.—There was a very large and varied display of roses at the "Flower Fair" held here in early May. There were good displays of other flowers, but the exhibits of roses were the main feature.

SAVANNAH, GA.—The annual floral exhibition which closed May 9 was the most successful ever given by the Floral and Art Association. The display was very creditable and the exhibition was a financial success.

LOS ANGELES, CAL.—The annual flower festival was as usual a great event. There was a large display and it was also a financial success, \$2,100 being the net profits which will be turned over to the charities interested.

WILMINGTON, DEL.—According to an article which recently appeared in a local paper Jacob L. Brown—still in the business here—was the pioneer florist of this city, starting in with one small greenhouse 35 years ago.

OSKALOOSA, IA.—The Kemble Floral Co. had some glass broken by hail May 12. The same was covered by insurance in the Florists' Hail Association, and the loss was promptly paid by the association.

WATERBURY, CONN.—Henry Precht, the florist, has purchased land on Chapel street in Simonsville and will remove his greenhouses there from the old Aaron Benedict site on South Main street, where they have been located for over a quarter of a century.

DEERFIELD, N. J.—Geo. M. Cole, one of the oldest and largest nurserymen in the state made an assignment May 7. He is a large grower of peach trees and the failure of the peach crop for the last two seasons has left him without demand for young trees.

WORCESTER, MASS.—The Higginson Botanical Club offers three prizes for collections of plants to be gathered during the coming season. For the best herbarium collected in Worcester county \$5 will be given, for the second best \$3, and for the third best \$2.

SAN FRANCISCO.—At the last meeting of the State Floral Society an interesting paper on pelargoniums was read by J. H. Sievers, the florist. The subject for next meeting will be "The fragrance of flowers and its commercial value," upon which a paper will be read by Emory B. Smith.

NEW YORK.—William B. Scott, florist at 407 Fifth avenue, made an assignment May 15 to George W. Stephens. Isaac Buchanan started the business many years ago, and when he retired he turned the business over to his employee, W. Scott, in July last, furnishing the latter \$1,000 special capital.

GRAND RAPIDS.—Several business changes have occurred here in the last six months. Fred Foster has closed up his florist business. Anke Tuinstra has also gone out of business, the greenhouse having been torn down and removed. John Doran started into business last fall in the northwest part of the city with one house 20x100.

LINCOLN, NEB.—A high west wind brought a heavy fall of hail May 9, the which has fallen here for four or five years. L. C. Chapin lost 300 or 400 feet of glass, covered by insurance in the Hail Association, the policy having been taken but a week before the storm. Other florists here suffered lighter losses. Plants were sadly damaged.

CHARLESTON, S. C.—The exhibits at the "Floral Fair" held the first week in May were equal to last year in quality, but there was some decrease in quantity owing to the weather which has been very unfavorable this spring. It was certainly a remarkably fine exhibit considering the drawbacks wrought by the variable season. The attendance was fair.

RIVERSIDE, CAL.—The grand carnival and rose show of the Woman's Relief Corps called out immense quantities of flowers and the attendance was very large. Among the floral designs was a huge one representing the old mission building at Santa Barbara. Its exterior was made of Saffron, Cloth of Gold and LaMarque roses, the roof of red roses in variety. The tower was surmounted by a cross of Marguerites as was also the gable at the front.

KANSAS CITY, KAS.—Prof. E. N. Plank, the botanist, recently returned from a collecting trip. For six years he has traveled over the state of Kansas devot-

ing his whole time to collecting specimens of the flora of this state. The specimens he has secured are now mounted and represent 2,000 species of plants. They have been carefully classified and the professor is compiling the results of his labors for a book which will be entitled "The Botany of Kansas."

HAVERHILL, MASS.—The first exhibit of the Haverhill Horticultural Club was held May 12 to 14, and was a very gratifying success. There was a very fine display of tulips and other spring bulbs as well as general collections of plants. Florists Geo. H. Hill, C. H. Kaulbach and C. H. McLaughlin, of Haverhill, and Otto Bauhaich, of Atkinson, N. H., each made excellent displays for which gratuities were granted by the judges. There were a large number of displays by amateurs.

UTICA, N. Y.—A meeting of local florists was held May 14 for the purpose of organizing a Florists' Club. The meeting was largely attended and the following officers were chosen: President, Jonathan Ancock; vice-president, C. F. Seitzer; treasurer, C. F. Baker; secretary, W. I. Crowe. John Matti, Wm. Mathews and G. W. Chatfield were appointed a committee to report by-laws for adoption. T. J. Griffiths and E. G. Brown were elected honorary members. The club starts with a membership of seventeen.

PHILADELPHIA.—At the last meeting of the Florists' Club there was a vigorous discussion upon the proposed import duty on plants. A resolution was finally adopted expressing the sense of the majority as against the proposed duty. There is however a considerable minority who favor the duty. It is proposed to spend \$25,000 on the proposed building for club headquarters. A portion of this sum has already been subscribed and it is expected that the remainder will be arranged for before the next meeting of the club.

NEW YORK.—The Market Florists' Association of New York City held its second meeting at the Mohawk Hotel, Spring and Washington streets, May 22, and perfected its organization. It was in-

tended to ask the park commissioners for the use of the plaza on the north side of Union Square as a site for a flower market, in place of the old site at Canal street and the North River, which is too small to accommodate the florists; but it was decided at this meeting, on motion of John Morris, the Jefferson Market florist, who is chairman of the site committee, to defer making the formal request until next fall. In the meantime Mr. Morris is endeavoring to excite public interest in the matter, and has already succeeded in securing the influence of several prominent ladies. The establishment of such a market in a central part of the city would add a picturesque feature to New York life, and as the business of the market is all over by 7 o'clock in the morning it would not interfere with traffic in the least.

Poor Pay.

A Brooklyn, N. Y., florist recently secured a warrant for the arrest of the proprietor of the Plaza Hotel. He stated that he planted a number of geraniums for him and that when he asked for his pay he got a thrashing instead.

At the Flower Show.

HE—"Isn't that bunch of lilies handsome?"

SHE—"Yes, but I should much rather have this bride's bouquet."

HE—"Will you carry one like it to my wedding?"

SHE—"Go and see papa first."

ARE THERE any "lima bean pole" geraniums among your stock for spring sales? If so, it will pay you better to throw them on the rubbish heap than to injure the trade by selling them to ignorant buyers. Sell only plants which you know will give satisfaction to the buyer.

SEND ME \$1.00

And receive, postpaid, 3 of my beautiful new DWARF GOLDEN

ACHYRANTHUS McNALLII,

and one NEW SCARLET GERANIUM that will surprise you.

Address **E. McNALLY,**
ANCHORAGE, Jefferson Co., KY.

We can now furnish in any quantity desired Debit and Credit Tickets of which we give below samples reduced one-half in size.

DEBIT. <i>Jan'y 10 1889</i>		
<i>John Smith</i>		
100	<i>Verbena</i>	3 —
50	<i>Geranium</i>	4 —
		7 —

CREDIT. <i>Jan'y 10 1889</i>		
<i>Richard Roe</i>		
500	<i>4-inch pots</i>	5 —
175	<i>2 1/2 "</i>	5 —
		10 —

The debits are printed in black and the credits in red, so they can be readily distinguished. They are put up in blocks of 100; 50 of each, placed back to back; thus but one block will have to be carried. By means of these tickets an entry on a sale or receipt of goods can be made anywhere—in the house or in the field—and afterwards filed. Tickets for each transaction in your business will make data from which a book-keeper can readily work. With this simple and easy means of keeping a record of your business can you afford to neglect so important a matter?

Price of Tickets, postpaid, 100, 20c.; 200, 35c.; 300, 50c.; 500, 75c.; 1000, \$1.40.

AMERICAN FLORIST CO.,

54 La Salle Street, CHICAGO.

Color of Letters on Floral Designs.

ED. AM. FLORIST.—I would like to call the attention of the retail florists to the color of the letters used in making up set pieces for funeral work. The prevailing tint now used is a bluish purple, and when photographed it can hardly be seen at all. If the custom of lettering both in natural flowers, and in manufactured letters must prevail, let the color tend to one that will show nicely in a photograph.

J. E. BEERE,
Denver, Colo. Photographer,

[The purple is mainly used because it is considered the most appropriate color for lettering funeral designs. Other colors are frequently used in other than funeral work. With the ready made letters now in use it would be a simple matter to substitute lettering of another color at the time the design is to be photographed. Red is a good color, we believe, for this purpose.—Ed.]

Nurserymen's Convention.

We give below a list of the essays which will be read before the annual meeting of the American Association of Nurserymen at the Park Avenue Hotel, New York City, June 4 to 7.

The question of new fruits, by Hon. H. E. Van Deman; Some remarks on grafting, by Prof. L. H. Bailey; Are hardy perennials desirable for our catalogues? by Jacob W. Manning; Can stock be dug and shipped too early in the fall? by G. E. Meissner; The cause of low prices for nursery stock, by Hon. S. M. Emery; Do we live and learn? by Thomas Mehan; Chestnut culture, by Samuel C. Moon; Does the future of our business look as promising as the past? by H. S. Wiley; Elevation of our business, by C. L. Watrous; Hardy fruits for the west and north, by Prof. J. L. Budd; Nurserymen, agents, tree peddlers and bugs, Geo. J. Kellogg; Advertising—how can it best be done? by G. J. Carpenter; Peach orchards of the west and south, by N. H. Albright; The relation of nurserymen to the forestry problem, by B. E. Fernow; A talk on fruit growing as a business, by S. D. Willard; The future of nut culture, by A. S. Fuller; Transplanting evergreens, by Fred W. Kelsey; Thoughts on soil fertility, applicable to the nursery, by Prof. L. P. Roberts; Home grown vs. foreign stocks, by E. W. Graves; New small fruits, by F. K. Palmer; Russian varieties of fruits, by Leo Wetz; Leaf blight on the pear, as affecting nursery stock, and its remedy, by Prof. B. T. Galloway; Has he ruined eastern farmers by his success in peach culture? by J. H. Hake; The grape, its character as affected by climate and situation, by G. W. Campbell; Suggestions for packing nursery stock, by a member to be named later.

The hotel, exhibition room and session hall will be all under one roof on the same plan as that which gave so much satisfaction at the convention held last year in Chicago.

NEW SWEET SCENTED CHRYSANTHEMUM
"Nymphaea." A decided novelty. Form and fragrance of Pond Lily. Fine for floral use. A so the cream of the cream of older varieties. Send stamp for plate of "Nymphaea," and Catalogue.

Bedding Plants.

Ceraniums, best sorts, from 4 inch pots, \$5 per 100 also Fuchsias and heliotropes. Well rooted root cuttings of double and single white and pink Bourdianas in mixture, \$10 per 1000.

N. STUDER,

Anacostia P. O., WASHINGTON, D. C.

June is here, but it is not yet too late to plant out in the field the strong plants of the grand new pink Carnation—

"Fred Creighton"

that I am now offering. Young plants of this variety planted out in the field about the 10th of June 1889 were exhibited at the convention at Buffalo in August, with from 8 to 20 long stemmed flowers and buds on each plant.

The returns from the sale of the flowers of this carnation inside of one month alone last winter was \$1.80 per square foot of bench room.

This is not the coming Pink Carnation, but the one that has come, and come to stay.

Strong, healthy young pot plants only will be offered this year, \$25 per 100. Twenty-five plants at hundred rate.

GEORGE GREIGHTON,
NEW HAMBURGH, N. Y.

Florist Bulbs and CUT FLOWERS.

THE WISCONSIN FLOWER EXCHANGE,
133 Mason Street, MILWAUKEE, Wis.

NARCISSUS.

An immense collection and an enormous stock of all the leading varieties, especially of those adapted for forcing. Many acres are now in flower, and 1 expect 1 shall have at least

A MILLION

of fine forcing roots to offer this season, and shall be pleased to give prices for any variety for **EARLY FALL** delivery. A preliminary list has been sent to my customers, and my General Trade Catalogue will be ready shortly.

CLEMATIS.

My stock for Fall delivery will be much heavier than previous seasons. The varieties consist of all the best kinds and may be relied upon. Also many other varieties of Hardy and Half Hardy Climbers.

PYRETHRUMS.

Many thousands of these are grown and form one of the most important families of my Florist Flower Department. Also Carnations, Phloxes, Delphiniums, Pansies, Fuchsias, Hollyhocks, etc.

HERBACEOUS PLANTS.

The increasing demand for this group, both at home and abroad, has necessitated my adding several acres of fresh stock, in addition to my usual stock which is immense. Every good hardy plant is grown in large quantities, and I shall be pleased to quote prices for anything required.

DAHLIAS.

An extraordinarily complete collection, every variety of every section worth cultivating will be found described in my Retail Catalogue, published in April. Trade list of Pot Kools published in the Autumn.

HARDY BULBS.

Many acres grown, forming the most important branch of my Establishment, Anemones, Lilies, Chionodoxa, Gladioli, Begonias, Montbretias, and hundreds of other families too numerous to mention here.

CHRYSANTHEMUMS.

Every variety up to date, including English and Continental, full descriptions of which will be found in my numerous Catalogues, which may be had on application.

AMERICAN FLORIST CO., 54 La Salle St., Chicago.

2-inch Pipes for Hot Water.

Regarding small or large pipes for heating with hot water I have to say that in arranging to heat the last house I put up I struck a lot of cast steam-boat tubes two inches in diameter which I obtained at the price of old iron; after the ragged ends were cut the tubes were as good as new; I got steam fittings for manifolds and cut sleeve connections from 2½-inch pipes and put all together with rust joints. It is the neatest and best working set I have. I am so well pleased with it that if I was beginning new again I would have all 2-inch pipes for hot water. Cooling down is all a myth; heating up is the question, and that is accomplished in much less time with the small than with large pipes.

My boilers are self-feeders and there is only a slight decline in the temperature of the water in the pipes after leaving them six to eight hours. Marine boilers are made and repaired in this place and I got cast steam boiler tubes nearly as good as new at low rates for all my houses; we cut and fitted them up ourselves. That decided the question of steam or hot water for me in favor of the latter, and as yet I do not regret it.

COSMOS HYBRIDS.

PLANTS FOR EARLY BLOOMING.

Seed sown in Jan. and Feb. checked several times to produce early flowers. Many are now in bloom, showing a fine mixture of pure white, deep red, rose, flesh color, and shades of each.

Introduced from Mexico a few years ago. Slightly resembles the Single Dahlia, but much more graceful and smaller. Very valuable for cut flowers on account of lasting quality. Blooms when other flowers are scarce and lasts a week after cutting.

Have already shipped them to 15 different States and Territories without a Complaint.

Remember my plants are for Early Blooming, thus overcoming the difficulty of flowering them before frost, when seed are sown later or in open ground.

SEND SIX CENTS FOR SAMPLES IF YOU HAVE ANY DOUBTS.

Finest mixed, strong plants \$5.00 per hundred. If too distant to order by Express, will "shake out" and mail at same rates.

Have enlarged my place and make a specialty of the COSMOS HYBRIDS.

F. R. PIERSON & CO.,

Tarrytown, New York, U. S. A.,

ORIGINAL AND LARGEST GROWERS OF

Lilium Harrisii Better known as The Bermuda Easter Lily

The Best in the World for Forcing for Winter Flowers.

WE OFFER ONLY STRONG FIELD-GROWN BULBS FROM OUR OWN GROUNDS IN BERMUDA.

THIS VALUABLE LILY IS OUR SPECIALTY.

We grow the bulbs by the acre on our own grounds in Bermuda. We were the first to grow it in large quantities and to offer it at reasonable prices, and we have always been recognized by the trade as

HEADQUARTERS FOR THE BERMUDA EASTER LILY.

Supplying the trade as we do both in this country and in Europe, and we hold by far the largest and the controlling stock of the genuine variety in the market.

The extent of our operations in this bulb alone will be best understood when we state that we expect to sell from OUR CROP of 1890, over a

HALF A MILLION BULBS.

Be sure you get the genuine Lilium Harrisii. In order to secure "the true variety," purchase your bulbs from original stock, which is known to be pure. The value of this Lily has led unscrupulous or ignorant parties to plant L. Longiflorum in Bermuda, or grow it there one season and send it out as Harrisii, and dealers should look with suspicion on bulbs offered at prices less than market rates, as the supply has never yet met the demand. "Mixed Bulbs" only being offered at reduced rates.

This is not only the best by far of all lilies for winter blooming, but it is one of the most profitable flowers that can be grown by florists. It is very easily handled, and the flowers being especially effective for decorative purposes, always command large prices. From its name some have thought it was a bulb for florists' use for forcing for the Easter market only. This is not exclusively so; it derives its name from the fact that, in Bermuda, grown in the open ground, it blooms at Easter time—hence the name "Bermuda Easter Lily," but by growing it in this country in the greenhouse, with successive lots, it can be had in bloom all the winter from early in December until after Easter; in fact, by special culture, all the year round, or as long as cut flowers are in demand. The fact that it can be forced into bloom by the Christmas holidays adds particularly to its value, as it fills in at a time when flowers are usually scarce and in great demand at high prices, but to accomplish this the bulb must be potted early in August, something depending upon after treatment and temperature when the bulbs are grown in.

For this purpose our Bermuda-grown bulbs are indispensable, as in Bermuda the bulb reaches its highest development, and ripens off perfectly, and is ready for shipment usually by the middle of July—before bulbs in our own country have hardly begun to make their growth. Our bulbs being grown in the open ground, in a climate naturally adapted for their perfect growth, are particularly strong and healthy at any time.

New Crop will be ready for delivery early in August. Orders booked for delivery at that date.

Large growers or dealers in this bulb should write us for special prices, stating quantity of bulbs desired, and we will give lowest estimate on the same by return mail.

F. R. PIERSON & CO.,

TARRYTOWN, NEW YORK, U. S. A.

Look Out for Him!

A man calling himself Joseph Schmidt, an Austrian, and having with him a recommendation from a man I knew to be a thoroughly reliable man and a good practical florist, wanted work from me. I took him on and after two weeks work he wanted me to advance him money to help him get clothes, he to pay it up by weekly installments. He was so plausible in every way that I did so. After working long enough to pay one fifth of the sum he owed me he skeddaddled leaving also board unpaid. He will likely turn up in Boston to play a similar game.

JOHN SPALDING.

New London, Conn.

[Since the above was received Mr. Spalding has forwarded to us a letter from another florist which shows that several others have been taken in by the same party.]

Snails.

I notice in your issue of April 15 a note on slugs among violets. I have been troubled exceedingly by them and was somewhat comforted to know that I had company in my misery. They have destroyed hundreds of pansy blossoms and violets. We call them snails here in Worcester. We have killed this winter, by actual count, 1,670. Have also been troubled by the sow-bugs referred to. They are very spry and like the darkness to work in. The snails or slugs may be baited with raw potatoes sliced up and placed around on the benches, for which they will leave everything else, and may be then caught easily and killed.

No. 136 W. 24TH ST., NEW YORK.

NEW HYDRANGEA

"RED BRANCHED."

"The most valuable of all the Hydrangeas of the Hortensia Class." Without doubt the most valuable of all Hydrangeas yet introduced. Trusses and flowers larger and brighter than those of Otakasi; a very free bloomer, producing large and magnificently-formed trusses from every shoot. The best known variety for forcing and culture in pots or tubs. Catalogue, giving description and prices, mailed free. 50th Year.

FLORAL * DESIGNS.

A book which tells how to make them and shows how they look. Fifty tinted plates of approved designs, in fine shape for showing to customers in place of the bare wire designs; it "gets there" much better, and looks pretty while doing it. It is a good investment for any working florist at \$3.50, postpaid, and can be had of

J. HORACE MCFARLAND,
Box 55. HARRISBURG, PA.

LONG'S Floral Photographs.

These fine plates—seventy-five in number—are now offered to the Trade.

They will help you to better priced orders for designs, bouquets, etc., as they give customers an exact idea of what to expect for their money. They will educate to the making up of more stylish work.

ARTISTIC. BEAUTIFUL. PERFECT.

The new book is a very great advance upon the old one, as we have covered the whole country by correspondence and obtained original lists of those in the trade in every city and town in the United States and Canada. We believe that the list is now as nearly correct as it is possible to get it.

AMERICAN FLORIST CO., 54 La Salle St., CHICAGO.

Soft Coal and Brick Flues.

In reply to the inquiry of J. C. R. in the FLORIST May 1, in regard to using soft coal with a brick flue, I answer: I have no difficulty in doing it, and prefer soft coal to anthracite, for the reason it is less labor to care for the fire. The cost for coal is no greater—I think less—and after I had learned to use it I found it easier to run the fire. My chimney is at the furnace, which has a direct damper for use in starting the fire and in replenishing with coal. The flue is eight inches wide by fourteen deep and goes two years without cleaning. An important point is provision for the admission of air above the grate to burn off the gas. I have never seen any ill effects produced by escape of gas into the house. The draft is good, as the chimney is always warm. First cost of my heating apparatus about one third what hot water boiler and pipes would cost. S. F.

—In answer to the inquiry of J. C. R. in regard to brick flues I would say my experience has been that unless the draught is exceedingly smart soft coal cannot be used without more or less gas escaping. I have used wood the past winter with great satisfaction. As I keep a night man I find no trouble in keeping my houses warmer than I could have done otherwise. I also found it much cheaper than coal, as the cost of wood delivered at my greenhouses was only \$2 per cord. W. E. SARGENT.

Worcester, Mass.

DID YOU SAY

You have not tried HUGHES' SOLUBLE

FIR TREE OIL,

And that you want an effective Insecticide, then do what other florists of experience and wisdom have done before you, and order at once a trial gallon. Read the previous numbers of the FLORIST to find out what it will do. Dozens and dozens of American testimonials have confirmed what I claim for it.

Stevens' Florists' Refrigerators

These are the only ones made that will keep Cut Flowers perfectly.

The Reason.
Because, the temperature is always even.
The air is perfectly dry.

They are never cold and warm, as the ice may be much or little in them.

This is why they do their work perfectly.

They take but little ice, and no salt.

GEORGE HEINT, Esq., the leading florist of Toledo, under date of March, 1890, says: "The florist refrigerator you put in for me two (2) years ago has been in constant use summer and winter ever since. Keeps cut flowers nicely from three (3) to seven (7) days, can then be taken out and will keep as well as ever. Uses but little ice. Cost me less than four dollars (4) the hottest month. It will pay for itself easy in the stuff it will save in one season. I would not be without it for double its cost. I never lose any flowers, as they keep until sold. Respect."

They are ornamental, can set in any place. Have glass doors in front to show goods.

The style and workmanship can be depended on. Circulars sent on application.

COLD STORAGE FOR BULBS, ROOTS, ETC.

B. A. STEVENS, TOLEDO, O.
The largest builder of Regular and Special Refrigerating works in the U. S.

Reduce your Coal Bills THE FURMAN STEAM HEATER

ESPECIALLY ADAPTED FOR WARMING GREENHOUSES.

Gives a most uniform heat night and day. Can be run with less attention, and a SAVING of fully 20 to 25 Per Cent. in Fuel over any other method. Burns HARD or SOFT COAL. Endorsed by leading florists. Send for full Illustrated Catalogue, showing how to pipe and heat a house by steam.

Address HERENDEEN MANUFACTURING CO., GENEVA, N. Y.

THE NEW FURMAN HOT WATER BOILERS

BURN PERFECTLY SOFT COAL. 56 DIFFERENT STYLES AND SIZES. Extract from OFFICIAL REPORT of the test made last winter by the Michigan

"Our greenhouses are each 20x50 and 10 feet high at the ridge. They were easily kept at 50 to 60 degrees on an average DAILY consumption of 88 LBS. OF COAL during Dec., Jan., and Feb., the temperature of smoke was practically the same as water in flow pipe, and your Boilers proved in every way very efficient."

A LARGE delegation of florists and dealers in florists' supplies, among them Messrs. Rolker and Manda, of New York, and Messrs. Craig, Lonsdale and Hancock, of Philadelphia, were in Washington June 3 and 4, to secure a hearing before the Senate Committee on Finance and to protest against that clause of the McKinley tariff bill which places an import duty on plants.

THE DATE of the sixth annual convention of the Society of American Florists is approaching. Are you arranging matters so that you can be in Boston August 19 to 22 to receive the benefits of that meeting, and to enjoy the hospitality of the florists and gardeners of the Hub?

THE PRESENTATION of Mr. F. Sander, the well known orchid collector and dealer, to Queen Victoria is taken by an English paper as a distinction which will be regarded as an acknowledgement of the supremacy of the orchid and a presage of still greater popularity.

The Nurserymen's Convention.

The fifteenth annual meeting of the Nurserymen's Association was held in New York June 4 to 7. The attendance was large, and the sessions were of marked interest, the delegates showing hearty attention to all the questions brought before the society. They represented almost all sections of the country; but the very large proportion of western growers was a positive revelation to those only acquainted with eastern interests in horticulture.

The meeting was opened by President Sweet, of New York, who delivered a timely address. He commented on the many changes in the trade; within the memory of middle aged men western New York had a practical monopoly of the nursery business, scarcely thirty years ago there was little or nothing done west of Buffalo. Now the nursery trade, like the center of population, has moved west, and at the present time more is grown west of Central Ohio than was formerly produced in the whole United States. In those old days there was only one secret of success, and that was to plant. Fortune soon followed, and there seemed no limit to the capabilities of the industry. Of late years the business has greatly changed; the difficulty now is not in producing trees, but in finding a market.

Mr. Sweet spoke of the value of the convention in trying to solve the question of industrial success, either in increasing the outlet or in determining a decreased production. The same question confronting the grower of cheap wheat confronts the nurserymen. Can the question be solved only by the law of supply and demand, or is it subject to artificial solution? Mr. Sweet said that in his opinion the best days for the trade had passed—that is, the day of large profits; for the future the business seems likely to reap but a moderate return. If this is so, it will be well to recognize the fact and arrange our plans accordingly. If the general public can once come to a right understanding of the small profits realized in proportion to the risks assumed we can sooner eliminate from the trade that class of adventurers who join the ranks only long enough to make a single planting, as a matter of temporary speculation. Such speculations, it is true, commonly result in loss to the speculators, but they tend to demoralize markets and work serious injury to legitimate trade. It is unfortunate therefore that the outside world does not more fully realize that no other business of like magnitude is subject to such extreme risks as ours. (Note. These remarks and some just following are so closely applicable to the flower trade that they might be made by a florist as well as a nurseryman.) To equalize risks there should be occasional chances for profit. This business has been ill repaid for 15 years past, but the

general decline in monetary value naturally affects all legitimate business.

The chief uncertainty in the immediate business future lies in the recently enforced Canadian tariff. The export trade is very large, and it would seem wise for the convention to consider the propriety of urging the adoption of a reciprocity treaty with Canada, which shall remove these artificial restrictions. Mr. Sweet continued that every new market we can open for our fruits, every new appliance for safe transportation, every new variety that will lengthen out the season, every new process for canning, evaporating or preserving will stimulate fruit growing and create activity in the trade.

Mr. Sweet's address, which was received with enthusiasm, was followed by reports of secretary, treasurer and special committees.

The first essay of the session was "The Question of New Fruits," by the Hon. H. E. Van Deman, United States Pomologist. He gave valuable data concerning the best introductions of the year, among well known fruits, and also suggested opportunities for the culture of fruits and nuts at present little known in the United States, particularly those adapted to the southern states.

The question box next claimed attention, most of the queries relating to questions of tree propagation. Some one brought up the subject of nomenclature, but it was said that it would take three governments to regulate and straighten out the tangle, and the matter was dropped like a hot potato.

Prof. Bailey, of Cornell University, gave an essay on "Root Grafting and Budding," illustrated by photographs of his experiments, which was followed by a brisk discussion.

J. Jenkins, of Ohio, was down for an essay on "Bugs that Bother Botanical Buccaneers." He urged his hearers to remember that he was neither a funny man nor a man of science, but his essay proved a very funny parody on the heavy science we get in a good many official reports, and it provoked a regular gale of laughter.

G. E. Meissner, of Missonri, delivered an essay on the question "Can Stock be Dug and Shipped too early in the Fall?" which was decidedly answered in the affirmative. The harm done by the hurry of a busy nurseryman, who must have everything ready for delivery at a certain time, was fully set forth. The evil of this practice, often very difficult to avoid, will be readily understood by any one who has bought much nursery stock.

The second day Prof. Meacham, of Philadelphia, gave a most interesting talk on the subject "Do we Live and Learn?" The venerable botanist was received with the applause that always greets his public utterances, as he spoke of his first appearance in horticultural papers, half a

century ago. He expressed some little disappointment in the progress made since then; practical science does not seem to have made the strides predicted in many directions. Relative to non-progressive ideas, the professor alluded to the practice of lopping off the tops of trees, under the impression that they then made a stronger growth because the roots had less to support. On the contrary, the quick growth following is due to the support stored in the trunk, while the sharp pruning gives a check to the vital power which finally lowers the stamina of the tree. In this matter, and in some other common practices, the professor decided that we do not always live and learn.

The Hon. S. M. Emery, of Minnesota, then gave a paper on "The Cause of Low Prices for Nursery Stock," which contained a good deal of solid sense for nurserymen to reflect on. He said that the demand at present is very great—there has been a great loss of stock, and yet prices are lower than ever. The contract system of growing, practiced quite extensively in some localities, was suggested as one reason; selling by agents was another. The agents or middlemen were quite severely handled all round; after hearing the candid opinions of the nurserymen it is a wonder how the tree peddlers and agents continue to exist. Mr. Emery treated his subject with frankness and vigor; many of his remarks about the competition of irresponsible dealers and the evil of the agent system apply pretty strongly to other branches of horticulture beside nursery stock.

The second day officers were elected for the ensuing year, they were as follows: President, S. M. Emery, Lake City, Minn.; Secretary, Chas. A. Green, Rochester, N. Y.; Treasurer, A. R. Whitney, Franklin Grove, Ill.; Executive Committee, Irving Rouse, Rochester, N. Y., W. J. Peters, Troy, Ohio, and Franklin Davis, Baltimore, Md. The next place of meeting is to be either St. Paul or Minneapolis, as the committee shall decide.

After this business was decided, J. T. Lovett, of New Jersey, answered the question "How can we best prevent duplicates in our mailing lists?" He explained his system of mailing catalogues, one of the excellent points suggested being the arrangement according to the same system as the mail list of a newspaper. Another good suggestion was the use of a reference book, in which the names were kept, with the addition of a cipher statement of results—whether the catalogue had received any response, whether it had resulted in an order, etc. By going through this list every two or three years the irresponsible names may be dropped out.

G. J. Carpenter, of Nebraska, gave a very bright talk about "Advertising: How can it best be done?" Mr. Carpenter is of the opinion that the best advertising a man can get is free advertising, which results from a well satisfied customer. Newspaper advertising is all right when you get a good paper and a good display, but he does not believe in a paper where they appear to load the ads. in a squirt-gun and let them drive just any space where they will stick. Nor does Mr. Carpenter approve of an advertising medium where they place the garden columns with a page of patent medicine ads., and put the nursery ads. opposite the column devoted to hogs. Mr. Carpenter's paper appeared to strike right home.

Mr. Albaugh, of Ohio, next read a very bright poem called "The Old and the

New," which Mr. Bellamy must have forgotten to put in "Looking Backward;" its personal hits brought down the house. A discussion about plant registration was called out by the reading of a very elaborate system suggested from California. It was a very modest little system, only about fourteen times more difficult than the Linnaean classification, and it offered to take in all the earth and the waters under the earth, until there wouldn't be a single unregistered plant at large. It was rather a relief to the stunned audience, after the suggestion was finished, when J. H. Hale, of Connecticut, moved that as it covered such a wide range it might be referred to the man in the moon. This matter was discussed by Mr. Parsons, of Flushing, Prof. Bailey and others.

F. W. Kelsey, of New York, spoke on the subject of "Transplanting Evergreens," followed by a discussion.

J. H. Hale, of Connecticut, told what he knew about peaches, detailing his struggles with that fruit on a Connecticut farm. A good deal of good natured chaff was thrown at him; Mr. Hale's peaches appear well known to the society, but his bright speech was much applauded and followed by a lively discussion.

The third morning J. W. Manning, of Reading, Mass., gave a paper on "Hardy Perennials in Nursery Catalogues." It appeared the general opinion that these plants might be catalogued by nurserymen to their advantage and without conflicting with regular plant growers. (Doubtful, though, whether they could compete with regular growers who make such plants a specialty.)

S. C. Moon, of Pennsylvania, gave an essay on "Chestnut culture," followed by discussion.

R. E. Fernow, Chief of Forestry Division, Washington, gave an essay on "The Relation of Nurserymen to the Forestry Question." A good many of the nurserymen disagreed with Mr. Fernow's ideas, and the subject was discussed by Messrs. Parsons, Meehan, Carpenter, Patten and others.

Mr. Williams, of New Jersey, made a few remarks about strawberries, exemplified by fine berries of Jessie and Pearl.

The relation of horticulture to the coming World's Fair being discussed, Mr. J. D. Reynolds, of Chicago, was unanimously endorsed as horticultural commissioner with flattering warmth.

Prof. Bailey offered a resolution requesting Congress to set aside \$5,000 of the \$100,000 appropriated to forestry, for the use of the pomologist.

After some further business details the convention then adjourned 'till next year.

EMILY LOUISE TAPLIN.

The Cyclamen.

Cyclamen persicum is the one that is grown and sold by florists as potted plants for winter decoration, and when well handled it is a beautiful, desirable and very satisfactory subject. It is indigenous to Greece, Palestine and other parts of Syria, and if grown under cool treatment will bear several degrees of frost with impunity, but it is far from being hardy here.

We do not handle it, however, in its typical form; of late years great improvement has been wrought in this species and we now have distinct varietal strains, for instance, grandiflorum and giganteum, also decided varieties of these strains. And of recent years named varieties are being raised and disseminated by European specialists in the same way

as are roses or geraniums, only let us be thankful they are less numerous. During the last three years the Royal Horticultural Society of London awarded first class certificates to the following new sorts, namely, in 1887: Majesticum, Princess of Wales, Queen of Crimson and Royal Jubilee; in 1888, Floribundum compactum, Dixon Hartland and Lord Millington; and in 1889, Faust, Striatum and Striatum Empress of India.

Cyclamens are propagated from seed, and a good thing it is, seedlings usually come true to kind in variety and type. And the foundation of successful culture lies in the seed. Get good seed and of the very best strains obtainable, and don't use seed of a commonplace strain even if you get it gratis. If your aim is a multitude of blossoms on a plant get a superior strain of the Persicum, but if your object is large, bold blossoms for plucking, the giganteum section is the best. And these gigantesms also make handsome pot plants.

Compact, beautifully marked, clean, healthy foliage is also a desideratum and earnestly worked for by James, Odell, Wiggins and other noted English raisers.

Sow the seed as soon as you get it, be that fall, winter or spring, in shallow pans or flats and in a warm greenhouse. The seeds may be scattered about one half to one inch apart, pressed gently into the soil and covered over barely more than one eighth inch deep. And I have found that seeds two or three years old are good enough and germinate freely. In due time as the seedlings come up they should be pricked off, then potted singly and repotted as their advancing growth should warrant.

Fresh, fibrous, porous loam is a good soil to use; some growers add a little old finely rotted cow manure, while other growers omit manure of any kind in the soil, and apply it later in the way of fertilizing libations after the pots get well filled with roots. Be particular that the drainage is ample, clean and effective, and that there are no angle worms or grubs in the soil.

A winter temperature of 45° to 55° suits the cyclamen admirably, and it should occupy a place near the glass in a light airy house, but not in the way of any draft. While in active growth it requires liberal but careful waterings, and in the forenoons syringing to keep the foliage clean and healthy, but this syringing must be discontinued when the flowers begin to open.

After blooming it is well to keep the plants plump and green till they show a decided tendency to rest, then water less copiously. During the summer months or resting period I place the pots out of doors in a slightly shaded place where they are plunged in a bed of ashes in the open ground or a cold frame, and only give them water occasionally in prolonged dry weather. About August they will show signs of again starting to grow, then they had better be repotted and plunged again and allowed to come along slowly in order to secure good roots before rank leaves. As soon after this as we care to we may take them indoors.

Seedlings should be kept in active growth from the time they germinate till after their first blooming period. Plants two to three years old are generally in their strongest condition.

W. F.

Nehumbium Speciosum.

(Lotus of India.)

This is a stately and magnificent aquatic, which makes leaves thirty inches

GIANT CYCLAMENS

across, and flowers from eight to ten inches in diameter. The foliage is of a rich glaucous green, attaining a height of four to six feet; while a set of smaller leaves float on the surface of the water. The flowers, borne on strong stalks a foot above the tallest leaves, are white at the base, the upper portion of the petals being suffused and tipped with bright rose pink, appearing like huge tulips, and delightfully fragrant. Now that it has proved hardy in this country, at least nearly, if not quite, as far north as Bos-

ton; and as all that it requires in the way of cultivation, is to properly plant a good strong clump of it and allow it to grow, every pond in the country should contain a mass of it. Aside from historic interest, it is of great value for florists' use, the flowers lasting cut for about three days; and nothing is more charming than these arranged with water lilies and other aquatic plants and grasses. Where a pond or other natural water is not convenient, a half barrel or hogshhead may be sunk in the lawn; or a tank may be form-

ed by making an excavation a foot deep and simply cementing the bottom and sides, either of which would be enough for a fine specimen which would give many lovely blooms. In the fall the tub should be removed to the cellar or greenhouse, where the roots would be free from frost; or the tank should be emptied of water and covered with a foot or two of leaves and some boards. The plants winter better if the soil is kept damp, simply to keep the tubers from shriveling, rather than if covered with water. BENJ. GREY.

Common Flowers for Decoration Day.

BY WM. FALCONER.

Among 123 different species of trees and shrubs that are more or less in bloom with us this (May 30) day, perhaps not more than 20 or 25 are worth growing by the florist to supply cut flowers for Decoration Day. Furthermore it depends a good deal upon the lateness or earliness of the season and the weather what hardy flowers shall be in season on the 30th of May; again, a great deal depends upon locality, for instance, while here on Long Island our common and Persian lilacs were all past by the end of May, about Boston and many other places probably lilacs were then quite plentiful, so that at best notes on this subject are only suggestive.

Common rough flowers, such as those of trees, shrubs and hardy herbaceous plants, may not be the material florists would care to grow to dispose of to city florists, but rather what they might grow for part of their home retail trade, and as everybody wants flowers on Decoration Day it might be to the advantage of florists to cultivate an assortment of these hardy plants. And quantity goes a long way. Expensive roses, carnations, orchids and other tender flowers are choice and beautiful, but under a drying wind and withering sun they make very little mark in an open cemetery alongside of big bunches of snowballs and dentzias.

While white flowers are, upon this as upon other occasions, the most desirable, colored flowers are also admissible, so florists can make their own selection.

Among trees proper the most important are hawthorn, laburnum, horse chestnut, magnolia, flowering ash and wild cherry. Among hawthorns the double flowering white, double pink and Paul's double scarlet are the best; the common single white is a little past its best. But no matter how much choicer the double flowering forms may be to many, they have no fragrance, and for this reason the single flowered, which is delightfully fragrant, is preferred by others. As a tree by the wayside it thrives as well as a cultivated specimen in the garden. But hawthorns are often unsatisfactory, being subject to borers and fungoid diseases.

Yellow laburnums of several sorts are at their best, so too is the purple flowered kind, common horse chestnuts are past, but the red flowering one is still in fairly good condition, and the double flowering white one is at, or only a very little past, its best.

Magnolia Umbrella is at its best and the flowers are quite good; *M. cordata* is also in fine bloom, but the flowers are worthless for cutting; on *M. Soulangiana* and other hybrid forms a few scattering flowers may be had, but the early blooming species are all past. Magnolia hypoleuca and *M. parviflora*, a choice and deliciously fragrant, are in perfection, but too rare perhaps to be included among common flowers.

The blossoms of the flowering ash (*Fraxinus Ornus*, also the rarer *F. floribunda*) are in good condition, beautiful, airy, white and fragrant, but very deceiving, as they wilt so soon after being cut.

Prunus serotina, the wild cherry, has just begun to open, its greatest fault is its commonness and the haste with which its petals drop. All the forms of *P. Padus* are past. In groves and along the wayside the fragrant flowers of the locust are opening out; along the lanes and margins of woods the horizontal branches of *Cornus alternifolia* are laden with umbels of bursting buds, and in the woods

there are quantities of *Viburnum acerifolium* in blossom. Although ordinarily only a shrub, hereabout we have many specimens of the wild *Viburnum Opulus* that are 15 or more feet high, and they now are quite showy, being copiously furnished with broad white cymes.

In the way of shrubs, snowballs, dentzias, spiræas, weigelas, tamarix, Ghent azaleas and rhododendrons are in fine condition, and the most important of all. And first in excellence come the snowballs: *Viburnum rotundifolium* is in splendid bloom, white as snow and the branches are bent down with their load of blossoms. *Viburnum plicatum*, although three or four days later, is also now white, pure, perfect and in lavish profusion. I regard this species as the finest of all garden shrubs and indispensable to the gardener for the decoration of his home grounds, and the florist for cut flowers. Contemporaneous with *V. plicatum* is *V. Opulus sterilis*, the common American snowball, with its massive bunches gracefully arranged near the ends of the shoots; but while its blossoms are beautiful and elegant its foliage is always crinkled with insect vermin, a disfigurement never observed in *V. rotundifolium* or *plicatum*.

Dentzia gracilis is still in fine condition, although a day or two past its prime. It is indispensable. Its blooming period, however, is somewhat brief, and the petals of outdoor plants drop more readily than do those of indoor forced ones. *Dentzia parviflora*, another handsome species that has a good deal of a spiræa look about it, is also in full bloom, but though more fragrant it is not as showy, useful or profuse as is *D. gracilis*. The forms of *D. crenata* will not be in bloom for some time yet. *Neviensia Alabamensis* is likewise beautifully in bloom. Its white fleecy flowers when they are in their best condition are quite striking, and the plants are hardy enough, but there is something about this shrub that seems to preclude it from common use. Sometimes it blooms freely, in other seasons rather sparsely, and only when in its finest condition is it attractive at all, and a heavy shower destroys its blossoms.

Spiræa betulifolia, *S. trilobata* and its variety Van Houttei, and *S. Santoniensis* are in good bloom and useful in their way. And these include all the spiræas now in bloom that are worthmunch. The *S. betulifolia* appears in the trade lists under a good many different names, with no intent whatever to deceive, but merely because of an imperfect knowledge of the different kinds. The chief trouble with *S. trilobata* is, that when cut the flowers drop off very quickly; the Van Houttei which is a larger and whiter flowered form is a little better in this respect. The double and single forms of *S. Santoniensis* which are so glorious in the south are only imperfectly hardy here, hence we never get the splendid snowy wreaths of bloom the folks south of the Potomac enjoy.

No philadelphus is in bloom yet. (On June 1st, however, *P. coronarius* showed a good many open flowers.)

Diervilla (Weigela) *rosea* and *D. grandiflora* in variety are in their greatest glory, and the variegated leaved sort is as floriferous as any. The white-flowered *grandiflora* is in perfection; "hortensis nivea" only opening, and "candida" not out yet. The very dark colored one called Desboisi is only beginning to bloom. Although these weigelas are very beautiful as shrubs, as cut flowers they wilt too soon to be serviceable.

Tamarix Africana is a mist of pink spray. On open, dry sunny ground it is a day or two past its best, but on level moist land it is in perfection. Its color is a little too smoky, however.

The Ghent azaleas are in full bloom and what a splendid show! White, yellow, pink, flame and crimson in a host of shades, and the air is redolent with the delicious odor of the blossoms. They are beautiful among cut flowers. But warm winds and hot sunshine mar the flowers and the swarms of big, noisy bumble bees that continuously infest them destroy them very much.

The rhododendrons are beginning to open, but they won't be at their best for a week or ten days yet. The shades of bright and delicate rose and pink, and bright crimson and some of the spotted varieties are very beautiful and choice among cut flowers, but really among the purples we have many repugnant shades.

The Chinese Fringe tree (*Chionanthus retusus*) is in full bloom, white, airy and pretty, but not so bold or showy as our native fringe tree (*C. Virginica*) which will not be in full whiteness till about the 4th or 5th of June.

Rosa rugosa alba is in splendid bloom and has been so for some days; it is, this spring, the earliest of all our hardy roses. A few buds of the typical *R. rugosa*, also of *R. Kantschatica*, *R. Nutkana* and *R. alpina* varieties have also opened. This pronounced earliness of the white *rugosa* is not regular, however, for it often happens that the alpinas come in ahead, and oftentimes the red *rugosa* is as early as the white one.

Among lilacs the only ones that are now in good bloom are *Syringa villosa*, a beautiful rose-colored species from China, somewhat new in gardens, and *S. Josikera*, of the two, *villosa* is the more desirable one but not the latest to bloom. Such species as *S. Amurensis* and *S. japonica* will not be in flower for some time yet.

The common broom, *Cytisus scoparius* is still in very fine bloom, in fact, it is to-day the most showy yellow-flowering shrub in our grounds. *Cytisus nigricans*, however, is far neater in habit, and its blossoms are of a deeper golden yellow color and borne in terminal, erect racemes. It is a lovely little shrub and extremely copious. We imported half a dozen plants of it last year. In our order we failed to specify "on their own roots," so when we got the plants we found they had been "worked" on laburnum stems five feet high. This gives them a ridiculous, unnatural and most forbidding appearance alongside of the golden bushes, close on the ground, of our old plants upon their own roots. But yellow flowers are not esteemed for Decoration Day.

Woody vines contribute a fair quota of serviceable material: We have yet a good deal of fair racemes of both white and blue Chinese wistarias, but we cannot use them for anything as the bumble bees have completely disfigured them. The long racemes of the Japanese *W. multijuga*, however, later than the Chinese, are now in their finest condition and less troubled by the bees. The American (*W. frutescens*) is not in bloom yet.

The trumpet honeysuckle and its varieties are in bloom but worthless because their flower buds and young growth are so much infested with plant lice; later in the season when they shall be rid of the vermin we will get the good of them.

But grandest among all our vines is the clematis—the beautiful forms of the patens type. The flowers are large, showy, abundant, and very desirable.

A FIELD OF CALLAS IN CALIFORNIA

Hardy perennials also furnish a large proportion of the common flowers used for Decoration Day.

The Siberian *Paeonia tenuiflora*, single and double, is past, but we have a good many Montan or tree paeonias in good bloom, and both the pink and crimson old fashioned double flowered European paeonias are in perfection. None of the Chinese hybrids or varieties are in bloom yet, but in a few days they will be a beautiful show.

The fragrant *Iris Florentina* is nearly past, but the noble *I. pallida* is in fine condition, as are also lots of German risers. *Iris Sibirica* is in bloom wherever, like *Tridescantia Virginica*, it can establish itself as a weed, but its flowers are poor. The bulbous Spanish irises are also in bloom and quite desirable.

The pyrethrums are beautiful. The single varieties are in full bloom, but the doubles are only opening. And I raised all these singles a year ago from seed and now I can cut hundreds of daisies, large and bright and from the purest white and most delicate pink to the brightest crimson, and all are pretty and excellent for cutting.

We have lots of columbines of many sizes, shades and forms, and single and double. Though very good for garden decoration and not out of place as cut flowers for home use they are of little avail for cutting for traveling, they wilt too readily. How much superior are the elegant long spurred American sorts to the stiff short spurred kinds of the old world, also how much better are the true species than the hybrid progeny.

We have a sea of poppies, annual and perennial, all growing up and blooming together. Annuals of the Rheas, *Levigatum* and *umbrosum* types and from fall-started self-sown seedlings are now opening brilliantly, but none of the blue paeonia or somniferum varieties are out yet. Annuals sown this spring will not

be in bloom before the latter part of June or first of July. Although the varieties of *Papaver nudicaule* and *alpinum* are in good bloom they are not bulky enough to make much show among cut flowers. The perennial Oriental poppies on a warm sunny bank are beginning to open, but not for a week yet will they be out in all their vivid splendor. Poppy flowers if gathered as soon as open keep well for a couple of days, indeed there is more danger from wilting than from dropping their petals.

Perennial lupins grown on sandy land are quite showy and well worth cultivating. The prevailing color is blue, but white is also plentiful.

Salvia pratensis in all its varieties is in its heyday and although a vigorous hardy plant and copious bloomer, its cut flowers are not very satisfactory.

Heimerocallis Dumortieri is in fine bloom, it is the earliest of all, somewhat dwarf, and has a generous crop of orange-yellow flowers tinged with brown on the outside. The only other day lily in bloom is *Il. flava*, a showier and ranker species and of which only a few blossoms have yet expanded. Although *Anemone sylvestris* is in fair bloom and pretty in the garden it is barely copious enough for Decoration Day flowers. Gotten up in any quantity from seed.

Asphodelus luteus is very showy in the garden, hardy, free blooming and bold, but when we come to cut the spikes, between old flowers, fresh open flowers and unexpanded buds and swollen seed vessels all crowded together, I must say the spikes look a trifle shabby.

The double flowered ragged robin (*Lychnis Flue-en-culi*) is now common in many gardens, and although a little weedy perhaps, when cut it makes quite pretty bunches. The double *Lychnis Viscaria* is also plentiful and pretty. *Bonning Bet* (*Saponaria officinalis* fl. pl.) is hardly advanced enough for cutting.

The bold clumps of *Baptisia australis*, an excellent perennial with blue lupin-like flowers, afford us a large gathering. The *Fraxinella*, purple and white, is big, bushy and generous, but its flowers are sticky and unpleasantly odorous and always better looking growing on the plants than when cut. When *Vincetoxicum acuminatum* becomes better known it will be largely grown for white flowers; it is hardy, free growing, free blooming and easily propagated by division, and better still, it is insectivorous, its specialty being mosquitos. The Solomon's seals (*Polygonatum*) are in good bloom; the best forms of multiflorum and the Japanese *macranthum* are about as good as any. And if it were not for its great abundance wild in the woods about here I would also include *Smilacina racemosa*, which now is in fine bloom.

To these may be added biennial stocks that had been wintered in frames, 10-week stocks sown last February, double sweet alyssum, fall-sown snapdragons, Iberis Gibraltarica from cold frames, where also we yet have pansies, daisies and late forget-me-nots. And late tulips as *Gesneriana*, *carinata* and the like.

And we had quite a nicelot of ten roses. They were one year old plants grown in pots last summer, wintered in a cold frame and planted out in a warm sheltered place in April.

Glen Cove, N. Y., June 5.

Callas in California.

The accompanying engraving is from a photograph of a field of callas grown by the Central Park Floral Co., Los Angeles, Cal. There were at least 25,000 blooms on this field when the photograph was taken, May 10. The plants averaged about five feet in height and were grown from small sets planted eighteen months ago. How an eastern florist would like such a field to cut from at Easter time!

Epacris.

In old gardens in Europe epacris are much grown and esteemed both for conservatory decoration and cut flowers, but with us here they have not yet installed themselves so favorably. They are Australian woody plants, of dwarf growth and very amenable to pot culture, behaving well under the same cultural conditions as are accorded to soft wooded heaths like *Erica Wilmoreana* and *E. hyemalis*.

Some of the grand old gardeners around Boston, for instance, C. M. Atkinson, F. L. Harris, James Comley and D. Allan, grow epacris beautifully, and at the winter and spring meetings of the Mass. Hort. Society sprays of these antipodal beauties are often exhibited.

They are what we term cool house plants, that is plants that do not require a winter temperature of more than 45° or 50° or less than 35°. Grow them in pots seemingly small rather than over large, and be especially particular about the drainage that it is perfect, and made up of small potsherds rather than large rough ones. In Europe fibrous peat and sharp white sand is the usual compost employed for them, and sometimes a fourth part of loam is added. Here where we seldom have good fibrous peat we just use turfy fibrous loam chopped or rubbed fine, or with a little pounded charcoal added. In Europe the plants are continuously grown in pots and indoors except a little while in late summer when they are plunged in a bed of coal ashes out of doors for a couple of months to ripen up their wood. Here our method of procedure is different. Some growers keep them in pots all the year round, but plunge them out in early summer in a bed under a top shade of laths, but open on all sides; others turn the plants out of their pots and plant them right out as one would a carnation. When planted out they should be lifted and potted about the end of August or first of September, so as to get them well established in their pots before blooming time.

Some of our best growers use a lath shading over these plants in summer, others again insist that this is not only useless but detrimental. The splendid heaths grown by John Gardner, of Jobstown, N. J., are very well known by eastern florists, and Mr. G. assures me that his main point of success is setting them out in summer in an open well exposed situation where the winds from every direction can sweep around them freely and where he can hose them copiously. And so it is with epacris.

Epacris are propagated from cuttings of the current wood in the same way as are heaths, in a close frame in a greenhouse. A vital point is to wipe the inside of the sash dry every morning.

After blooming, the one year old shoots of the plants should be well shortened back so as to promote stockiness, for compact specimens only are salable as plants in bloom.

Epacris, being evergreen, should never be allowed to get dry, at the same time particularly avoid over watering, and the least indication of water logging in the case of potted plants should be remedied as soon as observed, so as to save the young roots which otherwise are apt to be killed.

There are two classes of epacris distinguished as early and late blooming; the early blooming ones come into flower between January and April, the late bloomers between March and June, according to kind and treatment. Best

among the earliest are *E. hyacinthiflora*, white, or its pink forms; *Mont Blanc*, white; *The Bride*, pearly white; *Vesuvius*, crimson; *Sunset*, reddish pink; and *Salmonica*, salmon. Prominent among the late blooming kinds are *Longiflora*, crimson tipped with white; *Longiflora splendens*, brighter than the typical form, and also *Eclipse*, bright red tipped with white.

The varieties shown in the engraving are: 1, *hyacinthiflora candidissima*, white; 2, *h. fulgens*, pink; 3, *ardentissima*, crimson; 4, *rubella*, bright red; 5, *Sunset*, reddish pink. W. F.

Cutting Down Chrysanthemums.

Far be it from me to unduly exult over a comparative universal recognition of the merits of the cutting down system, but it is only natural I should feel some degree of pride when I find that those who were opposed to, or could not agree with cutting down, now begin to see there is merit in it, and that the more it is practiced the greater the success of the cultivator. Although I have given every publicity to my system of dwarfing and grouping, every year I get numerous inquiries from the trade, gentlemen's gardeners and amateurs. I have answered many letters privately, but it is a matter of impossibility to answer all, and a few remarks in the *Garden* on the most important points to be observed may reach many inquirers. By practical experience I have proved and shown what can be done by the cutting down system, both for exhibition and home decoration, and the following are the most essential points:

The plants should now be well established in 4-inch or 6-inch pots and standing out of doors in a good open position. For cutting down in any district in the neighborhood or south of London the following dates would suit. On Friday, May 30, or Saturday, May 31, I should cut down the latest varieties to within 2 inches, 4 inches or 6 inches of the ground; about the following Tuesday I should cut down another batch; again on the following Saturday another still earlier batch; and on the following Wednesday or Thursday I should finish up with the earliest batch. That would bring us on to June 11 and 12, which would be right within a day or two, but no more license than that should be given. The first batch to be operated on would include *Princess Teck* and the various sports from that variety, *Boule d'Or*, *W. G. Drover*, *Pelican*, *Meg Merrilies*, *Ralph Brocklebank*, *Thunberg*, *Mr. D. B. Chapman*, *Grandiflorum*, *Duchess of Albany*, *Gloriosum*, etc. The next batch should include *Princess of Wales* and the various sports from that excellent variety, *Jardin des Plantes*, *John Salter*, *Barbara*, *Mr. Brunles*, *Baronne de Prailly*, *Japonaise*, *Mr. H. Cannell*, *Mrs. J. Wright*, *Mrs. Cannell*, *Belle Paule*, etc. The third batch should include the *Queen* section, *Mme. C. Audiguer*, *Edwin Molyneux*, *Mme. Laing*, *Florence Percy*, *Mme. Bertier Rendatler*, *Mons. John Laing*, *C. Orchard*, *Criterion*, *Lady Hardinge*, *Jeanne d'Arc*, *Venus*, *Refulgence*, etc. The last batch

should include the *Rundle* type, *Beverly*, *Mr. Bunn*, *Prince Alfred*, *Lord Wolsley*, *Mme. Lacroix*, *Elaine*, *Mons. W. Holmes*, *Mons. H. Jacotot*, *La Triomphante*, *Bouquet Fait*, *Wm. Robinson*, and others of the early flowering section.

After the plants had been cut down I should not put them under cover of any kind, as that would tend to weaken the young breaks; the more exposure the better; syringe and water as they require it. As they break, thin out the shoots, leaving three, four or five of the strongest. Repot into the flowering pots when the breaks are 2 inches or 3 inches long, and feed with liquid manure as soon as the roots are fairly established in the new soil. Eight-inch, 9-inch or 10-inch pots can be used, according to the variety and strength of the plant. Horn shavings or half-inch bones should be used with the broken crocks as drainage. The soil, in a good friable condition, neither too wet nor too dry, should be pressed very firmly around the ball. Keep well exposed as before and stake and tie out the young growths after they are well established. Secure the first flower bud that shows on the point by thinning out all side offshoots, leaving only the center bud. This should show about the first or second week in August; by that time the strength of the manure water can be increased, and it should be applied at every watering if the plants are strong and the pots full of roots as they should be by that date.—*C. Orchard, in London Garden.*

The Chrysanthemum.

[Extracts from a paper prepared by W. A. Manda and read before the Mass. Hort. Society, Boston.]

The genus *chrysanthemum* comprises nearly a hundred species. The one from which all the present varieties have been derived is supposed to be the *Chrysanthemum Indicum*, a rather inconspicuous single yellow flower. Through the zeal of indefatigable horticulturists this flower has attained almost the zenith of perfection.

The *chrysanthemums* at present in cultivation are divided into several classes, namely, the Chinese, Japanese, Anemone and Pompon. Each class is again subdivided into several others, and lately the hybrid varieties produced by intercrossing different types have brought forms that are hard to class in any particular group. Thus we have the Chinese incurved, Chinese reflexed, Japanese incurved and reflexed, Japanese anemone, pompon anemone, and so on. The aim of the raiser nowadays is to produce large flowering varieties; the substance, color, stem and habit of the plant seem to be secondary considerations. It is especially noticeable that while hundreds upon hundreds of new Japanese varieties have been raised every year, only very few of the Chinese class have been added, while the pompons are discarded and rarely met with.

When hybridizing, the principal object should be to improve upon the vigor and color of any varieties more than the mere size. A first class *chrysanthemum* should be of free growth, with stiff stems, the foliage clean and furnishing the stems up to the flower, while the flower itself should be of a good substance, well formed and of a pleasing color. The colors which are yet to be obtained, aside from the impossible blue, which I never expect to see, are a fine clear orange and clear bright red, which are wanted to brighten up our collections.

A great number of the leading varieties of *chrysanthemums* have been from time

EPACRIS.

to time imported from Japan, and when the hairy variety, Mrs. Alpheus Hardy, made its appearance it raised a sensation among chrysanthemum lovers, and we hope that variety may be a parent of quite a distinct class, although the seedlings raised from it have not yet produced any that were furnished with the glandu-

lar hairs which give to that variety its peculiar beauty. The majority of the chrysanthemums at present in cultivation have been raised in Europe, and of late years in America. Our country has started late, but has made up for the time lost, and at present the most valuable and esteemed varieties grown are

American kinds. The pioneers in this field were Dr. H. P. Walcott, John Thorpe, W. K. Harris and Arthur H. Fewkes, and lately there are quite a number of amateurs and florists who are raising new varieties every year.

A new variety should never be finally judged the first year, but must be grown

at least two seasons before it is well tested. Some of the most promising varieties have proven total failures the second year, while, on the other hand, many that have been condemned the first year have proven valuable when tried another season.

The hybridizing or cross-fertilizing of the chrysanthemum is a very uncertain work as regards results, owing to the mass of florets which are gathered in one single head. It is very hard to tell whether the floret has been fertilized with its own pollen or cross-fertilized with the pollen of another variety of the same class, but different color, through the agency of insects, especially bees, before the hand of the horticulturist has tried his own work on it; and it is for this reason that no raiser of chrysanthemums can say with any degree of certainty that any variety is a cross between such and such varieties, except when kept separate from all other varieties of the collection. In regard to the result it is also misleading; the colors of the supposed parents are sometimes never reproduced, and if you raise as many as fifty seedlings from the same head of flower you may get all colors, but none like the two parents.

In point of vigor of growth chrysanthemums vary considerably in various sections of the country, as well as in different seasons. Thus many of the varieties cultivated in England for exhibition can not be grown here with any success, and *vice versa*; while last year being exceptionally wet, none of the chrysanthemums planted out of doors did as well as usual. As to the various sections of this country, we find that in and around Philadelphia are grown the finest chrysanthemums in America. Some varieties also require different treatment from others; Mrs. A. Hardy, Crimson King, Belle Plante and others are very partial to excessive moisture. The same applies to pinching; some varieties if pinched late will not produce any flowers at all; such are grandiflora and others.

The culture of chrysanthemums is very simple when the cardinal points are well observed, namely, selecting strong, soft shoots for cuttings, and as soon as they are rooted never to allow them to suffer for want of root room or water, and after the buds are set to encourage them with liquid manure.

After the plants have done flowering, they should be cut down to about a foot from the ground and put in the cool house or a well ventilated frame. In January the offsets from the ground, and also from the stems or branches, will be from four to six inches long, when they should be cut and planted in sand, either in pots, boxes or the propagating bench; a south aspect and a temperature not above 55° by artificial heat are very essential. As soon as the cuttings have rooted they should be potted in 2-inch pots; from those they should be repotted in three weeks into 3 or 4-inch pots, and again when well rooted into 5 or 6-inch pots, by which time the first pinching takes place. After the plants are well established in the 5 or 6-inch pots they should be planted in their final quarters; if in pots, 10 to 12 inches is large enough to grow the best plants; if in benches or boxes, 4 inches of depth will suffice for the roots. Then comes the fixing of the plant to a neat stake, and tying it firmly, while pinching and pruning should not be neglected. The last pinching is done at the end of July, while the ground shoots are not allowed to grow, so that the whole strength may go into the main stem. When the buds are well set liquid

manure should be freely given, and attention should be given to the disbudding, as by leaving one bud to each twig you will have finer flowers, and the plants will also look better with fifty perfect blooms than with a hundred imperfect ones. When large specimen flowers are desired, not more than from four to six flowers should be left on each plant, so that this very limited number may have the benefit of the whole vigor of the plant. When standard plants are desired, the best way is to secure a strong shoot early in January, and leave it growing without stopping until it reaches the required height, when it should be pinched and treated in the same way as a bush plant. Planting out and potting in August may be practical, yet plants will suffer more or less by being lifted.

The place where chrysanthemums are grown should have all the light, sun and air from the time the cuttings are rooted until the time the cuttings are again ready to be cut. The soil that these plants seem to prefer is good turfy loam, well mixed with clay and enriched by ground bone, sheep manure or other manures or fertilizer.

Looking over the names of the thousands of varieties we find that a great many are not grown at all, while others could be dispensed with, and only those possessing the best qualities and distinctness should be kept.

Among the best old sorts we may count Alfred Salter, lilac pink; Brazen Shield, bronze color; Bronze Queen of England, Frank Wilcox, golden amber color; Golden Queen of England, yellow; Helen of Troy, deep rose; Hero of Stoke Newington, pink; Jardin des Plantes, golden yellow; Jeanne d'Arc, bluish white; Lord Wolseley, bronzy red; Miss Mary Morgan, pink; Prince Alfred, rose carmine; Venus, pink; Virginialis, white.

All the above are incurved, while among the multitude of the Japanese varieties those found to give the best results are Admiration, lilac; Bend d'Or, golden yellow; Ceres, white; Bras Rouge, dark crimson; Comte de Gerniny, nanken yellow; Duchesse, deep red; Ed. Andiguier, crimson maroon; Edwin Molynux; Elaine, white; Fantaska, coppery maroon; Gloriosum, yellow; Grandiflorum, yellow; Joseph Collins, coppery bronze; John Thorpe, deep lake; Marvel, white shaded; Mrs. G. Bullock, white; H. Cannell, Mrs. H. Waterer, white; Mrs. F. Thompson, white purple; Newport, rose; Pelican, white; Peter the Great, lemon yellow; Robert Bottomly, white; Robert Craig, pink; Sadie Martinot, yellow; Stars and Stripes, carmine; Superbe Flore, carmine rose; Thomas S. Ware, rose; Val d'Andorre, coppery bronze.

The reflexed are not so numerous but contain such varieties as Cullingfordii, brilliant crimson; Golden Christine, light yellow; Phœbus, yellow; Sam Sloan, pale bluish; President Hyde, rich yellow.

As the best anemone we may class Princess, delicate lilac; Thorpe, Jr., Mme. Cabrol, white; Bessie Pitcher, deep rose.

Those of late years' introduction that have proved superior to the already long list are Mrs. A. Hardy, white; Alaska, pearly white; Ramona, yellow; Adirondack, white; Monadnock, yellow; Narragansett, white; Mrs. de Witt Smith, white; Advance, pink; Avalanche, white; Excellent, rose; Belle Hickey, white; Belle Poiteatine, white; Colossal, pearly white; E. H. Fidler, yellow; Kioto, yellow; Capucine, vermilion; La Fortune, yellow; L. B. Dana, red; L. Canning, white; L. B. Bird, shrimp pink; Magicienne, chamois color; Mrs. W. K. Harris, yellow; Violet

Rose, rose; William H. Lincoln, yellow; Philippe Lacroix, rose; Snowball, white; Sunnyside, flesh color; Neesima, yellow; Mrs. Sam Houston, white; Mrs. Irving Clarke, pearly white; Mrs. Fottler, soft rose; Mme. Louise Le Roy, white; Miss Mary Wheeler, pearly white.

In naming chrysanthemums, the reform started by Dr. Walcott should be followed; that is, the names should be as short as possible, and certainly such names as Alaska, Shasta and Cortez are far preferable to such as our English or French competitors affix to their novelties; for example, Bronze Queen of England, Hero of Stoke Newington, Monsieur le Comte de Foucher de Cariel. By all means give us names that can be written on one label.

On the Rose and the Rose Plant Louse.

Conducted by CHARLES F. BAKER, Agricultural College P. O., Ingham Co., Mich.
Send specimens of unidentified insects and diseased plants to him at above address.

The Rose Plant Louse.

(*Siphonophora rosea*)

Among greenhouse pests, one that is troublesome to almost every florist, and one which is hard to deal with on account of its peculiar habits, is the rose plant louse, incorrectly called the greenfly. This insect belongs to the same family and genus as the wheat plant louse (*Siphonophora avenae*), which has created such great havoc in our grain crops during the last year.

If the lice live on outdoor plants the first eggs are deposited in autumn at the base of the buds. From these, there hatch, early the next spring, what are called agamic females, or females which produce their young without the intervention of the male. Between spring and fall there are a number of generations of agamic females, sometimes as many as eight or ten. One of the essentials in the production of these individuals seems to be a proper degree of warmth, so that when the cooler weather of autumn comes on, a generation of normal females is produced which lay eggs. It can be plainly seen that if the warm weather was indefinitely prolonged, there would be nothing but agamic females. This we find to be the case in the greenhouse, where a temperature resembling warm summer weather is maintained the year round. The rose plant louse is very prolific. It produces its young in large numbers and quite rapidly. Ream estimated that a single louse, in one summer or in five generations, might have six thousand million descendants. They congregate in large numbers on the leaves, tender shoots and flower stalks, and single individuals may be found on any part of an infested plant.

The agamic females (see fig. 1) are wingless, about one-eighth of an inch in length and of a shining green color. The antennae are as long or longer than the body, and the honey tubes are also long, reaching beyond the abdomen. The winged female has a shining black head and thorax, red eyes and a green abdomen, which bears fine black dots on each side just in front of the honey tubes. Behind the black dots are usually two short transverse black bands. The tail is yellow and hairy and the honey tubes black. The species is quite variable, a reddish variety often being found among the green. There is also a similar variation in color in the wheat plant louse during certain periods of its life, which

Dr. Fitch ascribes to a change of diet, from the coarser juices of the stalk and leaves, to the finer of the flowers. The variation is, however, probably due to the lice being parasitized. The rose plant louse, like other members of the same family, obtains its food by piercing the skin of the plant and sucking up the juices through its beak. When not in use this beak is folded under, between the front legs and against the breast.

Left unmolested, this louse is capable of doing a great deal of damage. It reproduces so rapidly that in a short time it will sap the vigor and vitality of any rose. A large number of remedies have been recommended and successfully used, but effectiveness is not the only thing to be considered. Ease of use, and time and cost of using must also be taken into account. Probably at the head of the list of remedies which are cheap, efficient and easily used, would come tobacco. This may be applied in three forms, an infusion, a powder, or smoke. To prepare the infusion, soak one pound of ones in six gallons of hot water to which one-half pound of size or soft soap has been added. The plants may be dipped in this or sprayed with it, but should be sprayed with clean water about twelve hours afterwards. This remedy should never be employed for plants having a wooly or hairy foliage. On account of the absence of odor, the powder is useful in conservatories. It should be applied by hand or by means of a bellows, when the plant is damp, and then cleaned off by a spray, in the same manner as when tobacco water is used. Mr. Peter Hen-

oil soap, and afterwards with clean water. A remedy which is not often tried by florists, but which is very effectual when used on any species of plant louse, is kerosene emulsion. This may be made as recommended for the carnation twister, in the *FLORIST* of April 1, 1890. It should be applied in the form of spray, and forcibly, so as to reach every louse. Repeating the application will soon reduce the lice to a minimum number. Other remedies which have been recommended, are quassia, soapsuds, fir-tree

louse. The egg hatches and the larva feeds on the substance of the louse, until nothing is left but the skin, when it pupates. It uses the old skin of its host for a pupa case, from which it escapes as a perfect insect in a very peculiar manner. The parasite of the wheat plant louse, leaves the louse by means of an opening on the back of the abdomen, made by breaking away a portion of the skin. In the case of the parasite of the rose plant louse (see fig. 2) the last two or three segments of the abdomen are broken away, except at one point on the lower side, thus forming a hinged lid which drops down, thus allowing the parasite to escape. It is very probable that this species has not been described. If it has not, an appropriate name for it would be *Ephedrus rosaphilus*.

Up to the present time the parasites have succeeded in almost entirely exterminating the lice. By looking very carefully over plants bearing the parasitized lice, the minute parasites can be seen flying about in considerable numbers. In a comparatively short time these little friends accomplished for us what we could not accomplish with any known remedy in the same time. It is therefore very evident that if the parasites are present and it is wished that they do their work in the most effectual manner, the greenhouse should not be fumigated. It would be expedient, however, to be very certain of the presence of the parasites before stopping the application of remedies.

May 27, 1890.

Spittle Insects.

A number of insects were lately received from a florist, who said they were injuring some imported plants, and that they

Fig. 2.

oil, Gishurst's compound, Fowler's insecticide, and Hurdman's beetle powder. No matter which is used, it should be applied thoroughly, and until the desired effect is produced. Mr. Peter Henderson says: "The main reason why remedies fail is owing to the fact that they are rarely long enough persisted in."

All insects have their enemies and the rose plant louse is no exception to the rule. These enemies include parasites on the insects themselves, birds, and lady-bird beetles. The beetles and birds devour the lice on outdoor plants only. The parasites attack them both in the open air and in the greenhouse, and belong to the hymenoptera, an order of insects which includes four winged parasites, ants, bees and wasps. It has been widely supposed that plants in the greenhouse were entirely at the mercy of the lice, or that being under cover prevented their enemies from reaching them. During the past winter roses in the greenhouses of the Michigan Agricultural College were affected by the rose plant louse. Towards spring large numbers were observed to swell up, turn black and die. Very small parasite hymenoptera were seen flying about the plants. They were not known to be connected in any way with the lice until some of them were hatched from the swollen and blackened bodies. These parasites (see fig. 3) belong to the genus *Ephedrus* of the family Braconidae and are characterized by a certain peculiar venation of the wings, by the joints of the abdomen being freely movable on each other and by the number of joints in the antennae. They are about two millimetres (.08 inches) in length. The head and thorax are black, the pedicel connecting the head and thorax, dirty yellow, and the abdomen dark brown above but lighter beneath. The legs are brown above and yellow beneath, though sometimes yellow all over. The antennae (see fig. 3) are cylindrical, eleven jointed and covered with fine short hairs. The first three joints are short, the fourth as long as the first three together, and the remainder, each about half as long as the fourth. In color, the antennae are black with the exception of the third joint and the base of the fourth, which are dirty yellow. By means of an ovipositor fitted for the purpose an egg is deposited by the parasite on or just under the skin of the

Fig. 1.

der son says: "In our new practice, every kind of plant that we know to be liable to be attacked by aphids, is dusted over with tobacco dust twice each week from June to October. Of course at such times as the roses or chrysanthemums are in flower, it must not be used, but these conditions only occur for a short season, and there is no necessity for the dust in winter, as then, fumigation with tobacco stems kills the aphids." To the practical florist the tobacco smoke is undoubtedly the best remedy for the rose plant louse. This should be used at night, and is generally made by putting the stems or dust on live coals. The next morning the house should be well ventilated and the plants thoroughly sprinkled. In the open air this remedy can be used by inverting a barrel over the plant, and placing a dish containing live coals and tobacco stems under it. In using this process care should be taken not to let the tobacco blaze. If repeated a number of times, this remedy is very effectual, the greatest objection to it being the unpleasant odor it leaves behind. On outdoor plants, before the buds begin to swell, eggs may be prevented from hatching by washing the plant with soft soap and water, or whale

Fig. 3.

lived under masses of froth. They were found to be true bugs of the family Ceropeidae, or frog hoppers, more commonly called spittle insects. During May and June the masses of froth are often seen on grass, spruce, in bunches of pine needles, and on various other plants. After the insect hatches from the egg it inserts its beak into the substance of the leaf and sucks up the sap. This is partly digested, the excess leaving the alimentary canal in the form of bubbles, which forms the froth. Under this it passes through all its transformations, and when the time arrives for the last moult the superficial part of the foam dries, so as to form a closed chamber about the insect. From this it escapes in the perfect form and wanders about on adjacent herbage and trees. Should they become numerous, their depredations would have the same effect on the plant as that of aphides or green flies. In such a case they can be easily subdued by the use of kerosene emulsion as recommended for the carnation twister in the *FLORIST* of April 1. This should be thoroughly and forcibly

applied, in the form of a spray. Fumigation with tobacco would probably not affect them as it does the greenfly, on account of their protecting cover of froth.

Naming Orchids.

The council of the Royal Horticultural Society have adopted the following rules for the naming of orchids for garden purposes:

Sec. I.—Genera, Species, well marked Varieties and Natural Hybrids.

1. The names of natural genera, species and well marked varieties, as well as of presumed wild hybrids, shall be written so as to accord with botanical language and usage, and to conform with the laws of botanical nomenclature (*Lois de la Nomenclature Botanique*) as adopted at the International Botanical Congress at Paris in 1867.

2. Exhibitors showing, for the first time, a plant under a Latin name shall be required to furnish the name of the botanist who has described the plant.

Sec. II.—Artificial Hybrids between Genera.

3. Every hybrid shall receive a generic name in Latin formed by combining the names of the parent genera and a specific name also in Latin, the sign of hybridity X being always added.

Sec. III.—Artificial Hybrids between Species.

4. Hybrids between species raised artificially shall be named in Latin, with the addition of the word *hybrids*, or of the sign of hybridity, X. (See par. 1.)

Sec. IV.—Artificial Crosses between Varieties.

5. Crosses between varieties raised artificially shall receive suitable vernacular names.

Sec. V.—General Recommendations.

6. The orchid committee shall decline to recognize any unauthorized name, or any name that is deemed unsuitable, or is not applied in conformity with the preceding rules.

7. A name once authoritatively adopted shall not be altered.

8. An award shall be made to any plant that is considered by the committee worthy of such distinction, even though it be unnamed, or not named in accordance with the preceding regulations, provided that, within a reasonable time, to be determined by the committee, a proper name be given. Any award made under these circumstances shall be suspended until the plant has been properly named.

9. The operation of these rules shall be prospective, not retrospective.

10. The council wishes to impress upon orchid growers the desirability of obtaining drawings or photographs of all new and certificated orchids, and of depositing such drawings in the library of the society for reference.

11. The council also desires to remind cultivators of the great importance of preserving specimens for future reference and comparison, and suggests that, wherever practicable, specimens should be sent for this purpose to the director of the Royal Gardens, Kew, England.—*London Garden.*

WE ALL HAVE OUR faults, and your business rivals have theirs; but don't forget that you are no exception to the rule. You have your good qualities, so have your business rivals. Look for these rather than the faults. You will not only be happier, but you will find that it pays.

AT A RECENT Boston wedding the bride stood, during the marriage ceremony, upon a mat of ferns and daisies.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Back ads. not admitted under this head.

SITUATION WANTED—As rose grower and propagator, or as gardener in private family. Address J. D. RAYNOLDS, Riverside, Ill.

SITUATION WANTED—As rose grower and propagator of general florists' stock. Married. Address C. R. care American Florist, Chicago.

SITUATION WANTED—By a practical gardener and florist. Single; German. Long experience in all branches. Only a first-class private place wanted. Address FLOREST, P. O. Box 263, Marysville, Marshall Co., Kan.

SITUATION WANTED—By practical florist; 13 years' experience; good rose grower and propagator of fine stove and greenhouse plants. First-class cut flower grower in general. Young, single man; English. References. Address VANDA, High Bridge, New York City.

SITUATION WANTED—By a first class American gardener, age 28, married, one child; have had 10 years experience in the business and can take charge of either private or commercial place. Good references. Don't answer unless you can give fair salary. Address CONN, care American Florist.

SITUATION WANTED—A German, 30 years of age, 8 with 10 years' experience and 5 years in this country wishes a position as first or second foreman in a commercial place. I am at present time employed as propagator in one of the largest rose growing establishments in this country. Best of references from last two places on hand. Address E. B. care American Florist, Chicago.

WANTED—Good second-hand greenhouse pipe for hot water, 1½ or 2-inch—quantity depends on size. WILL AUSTIN, box 810, Geneseo, Ill.

WANTED—Competent plant grower, single man, as partner. Splendid location, one mile from Capitol; cheap rent, lease, greenhouses, sash, team, etc. furnished. Little money required. Address F. LAMBERT, 563 K St., N. W., Washington, D. C.

WANTED—A good first-class grower of roses, carnations, bulbs and tender plants for cut flowers, also a general stock of greenhouse and bedding plants. Must have good references; sober and industrious. Good wages paid. Address GEORGE A. HEINL, Toledo, Ohio.

WANTED—An active partner with some capital, in the most promising nursery in the South. Business established, with more work than one man can attend to. The best of references and open to the fullest investigation. Address Mr. HOYT, 18 Broadway, New York City.

WANTED—For commercial place, a good florist, must be good propagator, grower of plants, roses, cut flowers, bedding and vegetable plants for market, and make up designs and bouquets; state age, experience and references. Address M. BULL, Ft. Rouge Greenhouses, Winnipeg, Man.

FLORISTS address your catalogues to P. W. JOHNSON, Lakeview Conservatory, Birmingham, Ala.

FOR SALE—Weathered boiler No. 4, \$85, in good order, never fired hard. R. MANN & SON, Lansing, Mich.

FOR SALE—Greenhouse, with or without house and lot, doing good business, no opposition. Address Dr. TERRY, Hudson, Mich.

FOR SALE—Florist business; city 50,000 inhabitants. Splendid retail trade in and out of city. Well stocked and equipped. For reasons and particulars, address OHIO, care American Florist.

FOR SALE—Third or half interest in a well established and increasing business to experienced man only one who can pull off his coat with the present owner. Further particulars, address MEMPHIS FLORAL CO., Memphis, Tenn.

FOR SALE—Florist business in a lively town of 15,000 inhabitants, 5,500 feet of glass, beside the hotbed sashes, steam heat, city water; houses in good repair, and well stocked. Must be sold by July 15th. Address 585 South First Street, Stillwater, Minn.

FOR SALE—A well appointed wholesale floricultural establishment; 32,000 square ft. of ground, covered with glass, in a lively suburb of New York City. All cut flowers are sold on the premises to first-class retailers, and the demand exceeds the supply. Excellent reasons given for selling. Price, \$24,000, one-third cash, balance on hand and mortgage. For particulars, address

THOS. W. WEATHERS'S SONS, 46 and 48 Marion Street, New York City.

FOR SALE.

Astoria Nurseries, Astoria, N. Y. Having purchased the larger part of the stock of Wm. C. Wilson, and wishing to reduce same preparatory to moving to new location, offer bargains in all varieties of plants, heating apparatus and greenhouse structures also for sale.

PIPE AND BOILERS FOR SALE.

We still have left some Hitchens—4-in. diam., 9 ft. pipe at 30c. per foot; also 5 ft. pipe, 4-in. diam., at 7c. per ft., in good order. One Hitchens No. 17 and several Meters boilers cheap. Write for prices.

COMMERCIAL RATINGS.

Under the head of "A Suggestion" in another column Mr. Copeland calls attention to the desirability of a "blue book" giving the financial standing of each one in the trade. The idea is not new. Quite a number suggested, to us while we were compiling the last edition of our trade directory that a valuable feature could be added to the book by giving a rating on each firm or individual. Very true indeed, but is the trade yet prepared to pay what such service would cost? We feel assured that it is not.

A rating to be of any value whatever must be accurate, and to secure reliable information regarding the actual financial standing of each one in the trade, scattered as they are over this vast country would cost a very considerable sum. Reports filled out by the individuals themselves would be absolutely worthless, and worse than none in the cases where accurate information is especially desired. And information obtained from business rivals would be unjust in many cases. The only proper way would be to follow the methods employed by the commercial agencies—employ a competent attorney in each city and town to ascertain the financial responsibility of each one in the trade in his locality, examining the records of the county to learn in whom the titles rest and whether there are any encumbrances upon the property, etc. Then the book should be published annually at least, and the services of the attorneys retained to report as they occurred any changes during the year.

This would cost the trademore than to make use of the services of the existing commercial agencies. They as yet do not list many of the florists, but special reports can generally be secured through them, and probably if the matter was presented in such a way as to convince them that there was a sufficient demand for a special list of ratings on florists, nurserymen and seedsmen only, they would undertake to prepare such a list, which with the facilities they have at command they could compile at much less expense than could any one not possessing such advantages. If those willing to pay a fair price for such service will report to us, and the number is sufficient to make a respectable list, we will submit the case to the commercial agencies and see what can be done.

COLOR.

No thoughtful man will fail to admit that the nomenclature of colors is in an almost hopeless jumble. If any evidence were wanted a reference to the florists' and seedsmen's catalogues would supply it in appalling abundance, for except in the cases where descriptions have been

copied from one catalogue into another each writer of the description has seen a different color; in some cases varying widely and in others slightly, but still different.

That some authoritative standard is needed was the first thought in connection with this matter, but a careful search revealed the fact that none existed. The second thought was a bold one—if there is no standard, then let us establish one. The difficulties were numerous, but we have made some progress and hope within the coming year to present a code or chart of colors which may be the standard for florists at least. About a year ago we commissioned Mr. H. H. Battles, of Philadelphia—who is both a florist and an artist—to prepare a chart of colors, conforming as nearly as possible to the prevailing popular feeling in their nomenclature. He obtained all existing works on the subject, classified thousands of samples of fabrics and other colored objects with the names given the various shades of color by the manufacturers and the public, consulted artists and experts and will crystallize the results of his labors in a chart of colors giving the typical primary colors with the various shades most commonly employed in descriptions, particularly in the descriptions of flowers. This we hope to be able to present to our readers in the form of a colored lithograph and as a supplement to the paper. The expense will be heavy, but we believe that the benefit will be so great as to warrant the expense.

THE NURSERYMEN AT NEW YORK.

The American Association of Nurserymen which convened at New York City June 4, held a very successful and a representative meeting. The weather, for the season, was almost too warm, but the hall was a cool and very quiet one, with ample accommodations for the business sessions, and the hotel arrangements left nothing to be desired. The usual three sessions per day proved so monotonous that the attendance was straggling many times. We feel sure they would profit much by adopting the two session plan now followed by the Society of American Florists as adopted at their Buffalo meeting. The competition by foreign nursery agents was somewhat bitterly complained of, but practical suggestions for relief, outside of the 20 per cent advance in the present tariff bill, were not made. Combinations of largest growers of general stock looking towards fair uniform trade prices were talked of, but resulted—publicly at least—in nothing but talk.

That old question of low prices with the same story of depression in trade and consequent hard times, was not the least important matter discussed by the nurserymen at their New York meeting. President-elect Emery, of Minnesota, provided a little food for thought when he remarked in substance: "We have a homely but expressive saying out west 'God Almighty hates a coward.' Now if growers will ask a fair full price for their nursery stock of whatever kind, and provide a first class article, they will sell it, but if they haven't the courage to hold to their convictions and maintain those prices which they *know* they must have to pay a living profit, then they must suffer the consequences." Is there any reflection for the florist here?

AN EUROPEAN rosarian thinks that Rosa laxa will make a stock which will be valuable for use in the American climate on account of its being indigenous to Central

Asia and very hardy. It is also claimed that it never forms any suckers, and that roses budded on this stock take very easily and join firmly, never falling off as sometimes happens with the Manetti. We should be glad to hear from any American growers who may have used this stock.

THE ILLUSTRATIONS of giant cyclamens and epacris which appear in this issue were engraved from colored plates published in the *Revue de l'Horticulture* Belge of Ghent, Belgium, as was also that of Eichhornia crassipes which appeared in last issue. Our illustrations of tuberous begonias and gloxinias in recent issues were engraved from colored plates published in *L'illustration Horticole*, Brussels, Belgium.

THE Buchanan Manufacturing Co. send us a sample of their "fruit and berry picker" which they request us try "for picking off roses or twigs." The picker is worn on the thumb and is provided with a cutting tool shaped much like the nail of the thumb. It is simple and inexpensive and we have no doubt will be found useful to the florist in the operations of pinching back plants and picking flowers.

MR. E. G. BROWN, Hamilton, Ont., sends up a photograph of a calla bloom having two spathe, the outer one being fourteen inches in length and shaped very much like a leaf though pure white. Of no further interest than other abnormal developments of the calla which have frequently been noted in these columns.

AT A RECENT charity fair in New York Mrs. Grover Cleveland presided over the flower booth and the customers for her roses, which were held at from \$5 to \$10 each, were so numerous that it was necessary to form a line. Talk about the high prices charged by florists is no longer in order from the daily press.

"THE FAIRLAND OF FLOWERS, a popular illustrated botany for the home and school," by Mara L. Pratt, is a quarto of 154 pages, of which a copy has been received from the Educational Publishing Co., Boston. It is designed for the youngest pupils, and as such may be useful.

A MAMMOTH VERBENA.—Mr. John F. Rupp writes us that one of his mammoth verberna plants has borne flowers as large as a silver half dollar and desires to know whether any other florist has succeeded in growing flowers of such size. He considers it "quite a monstrous freak."

MRS. CLEVELAND is the name given a seedling H. P. rose by E. Gill, Oakland, Cal., the raiser. It is described as being of dwarf habit, very free blooming, the flowers of great substance and resembling Jacquin color.

"THE RAINBOW" ROSE, a sport from Papa Gontier, was exhibited at the recent flower show at San Francisco and the local papers print many eulogistic notices of it.

Catalogues Received.

Geo. Creighton, New Hamburg, N. Y., carnations; J. J. Van Loghem, Haarlem, Holland, Dutch bulbs; Laurent Carle, Montplaisir, Lyon, France, carnations; Dammann & Co., San Giovanni a Teduccio, Italy, bulbs and orchids; Osman & Co., London, England, nurserymen, seedsmen and florists' requisites.

St. Louis.—May 26 a banquet was given at the Southern Hotel by the trustees of Shaw's Garden in consequence of the following clause in the will of Henry Shaw: "I hereby bequeath one thousand (\$1,000) dollars annually for a banquet to the trustees of the garden, and to the guests they may invite, literary and scientific men, and friends and patrons of the natural sciences; to be paid each year out of the funds derived for the support of the garden; also \$400 annually from the same fund for a banquet to the gardeners of the institution and invited florists, nurserymen and market gardeners of St. Louis and vicinity, said banquet to be presided over by the director of said botanical garden." This was the first banquet given by the trustees and was an elegant affair.

On the Seed Trade.

SEED TRADE ASSOCIATION.

ALBERT M. McCULLOUGH, Cincinnati, president; JOHN FOTTLER, Jr., Boston, secretary and treasurer. The ninth annual meeting at Cincinnati, June, 1891.

American Seed Trade Association.

The eighth annual meeting of the American Seed Trade Association was held at Saratoga Springs, N. Y., June 10-11.

In addition to the usual routine business a committee was appointed to go at once to Washington for tariff consultation.

Mr. Albert McCullough, of Cincinnati, was elected president, and Mr. John Fottler, Jr., of Boston, secretary.

The next meeting of the association will be held at Cincinnati, O., June, 1891.

W. A. Eschbeck mortgagee's agent representing Ephraim Everitt (\$1100) and A. C. Nellis (\$183.37) is now in charge of the business of J. A. Everitt & Co. at Indianapolis. They report assets, stock and book accounts (no mention made of lists of customers' names) \$1,400; liabilities, \$5,000 to \$6,000. Talk is made of paying 25 cents on the dollar.

Steam Heating.

In answer to J. C. S. would say we would not use high-pressure at any cost. Low-pressure will do the work required with not exceeding five pounds pressure. The water level of the boiler must be one and one-half or two feet lower than the lowest point of the circulating pipes.

CARPENTER FLORAL CO.

November 11-15, Indianapolis.—Chrysanthemum show, Society of Indiana Florists.

November 12-13, Worcester, Mass.—Chrysanthemum show, Worcester County Hort. Society.

Hardiness of Nelumbium Speciosum.

I would like to have the opinion of cultivators of aquatics as to the hardiness of Nelumbium speciosum. In his catalogue Mr. E. D. Sturtevant says the plant is hardy and classes it with his hardy aquatics, while on the other hand Messrs. Siebrecht & Wadley say it is not hardy.

I would be glad to know which is correct, and believe there are others who would like to have the facts. I do not doubt the truthfulness of either of the gentlemen named, but it may be that they have cultivated this plant under different conditions. Let us hear from other cultivators. LETTA SPENCER.

Hudson, Mich.

The Boston Convention.

ORCHIDS. ORCHIDS.

June 19th. THURSDAY, June 19th.

An important sale of Orchids will take place on Thursday, June 19th, at the Salesrooms of Messrs. Robert B. Young & Co., 205 Greenwich Street, New York, from Mr. FREDERICK MAU. The sale will include the choicest and rarest varieties from his collection, which he will sell on account of removal. Amongst them will be found *Cattleya Bogotensis alba, true*; *C. Trianae alba, true*; *Laelia elegans grandiflora*; *Odontoglossum Spatacenn*; also fine collection of 35 distinct vars. of *C. Trianae*. At the same time will be offered a grand lot of fresh imported *Cattleya Mossiae*, *C. Speciosissima* and the old favorite *Cattleya Trianae*. Plants are in the best possible condition, and guaranteed *true* to name.

Also a collection from I. Forstermann, Newtown, L. I., which will include *Vanda Amesiana*, *V. Kimballiana*, *V. cœrulea*, *V. suavis*, *Laelia anceps alba, TRUE*; *Cypripedium Spicerianum*, specimen plant; *Cyp. nitens*; *Cyp. Ashburtonæ*, and *Cyp. Venantum*. Catalogue on application.

A Suggestion.

In an article in the issue of May 15, 1890, there is mention made of the Florist's Protective Association for the collection of bad debts, which has induced me to make the following observations and suggestions:

Why not go a little further with such an association than simply the collection of bad debts? viz.: in what is called a blue-book, giving each one in the trade a proper and true rating, being supplementary to, but not supplanting, the ground covered by the directory issued by the AMERICAN FLORIST.

This can be accomplished by printed forms, for which the following is a suggestion: Name, city or town, county, state, merchant, seedsman, nurseryman or grower, wholesale or retail, capital or value of property invested, value of property outside of business, if any, how much mortgaged for, married or single, if married, how many children, if any, whether good, fair or slow in paying debts, reputation for sharp dealings, reputation for renaming or substituting, reputation of seed, whether good quality of goods is generally kept in stock, advice as to selling goods on time, C. O. D., or cash with order, and perhaps more in the way of remarks to cover individual cases.

There is no good and valid reason why this could not be carried out. Other trades have such associations, why should not we as well? It would certainly be of value to members, and of course it is understood that only members are entitled to information from such books.

Think it over, but if you wish to see such an affair put in working order do not stand back and look idly on, but go out, take off your coat, roll up your sleeves, and put your shoulder to the wheel and help it up the first hill. It will take care of itself after that, to a great extent.

ALFRED B. COPELAND.

NEW SEEDLING CHRYSANTHEMUM "ORANGE BEAUTY."

This novelty has been in bloom with us last year from September until June and is now in full bloom. We can supply fine plants in 2½-inch pots at \$1.10 per 100 plants, or \$10 per 100. Also a large stock of Grand Duke Jasmine, 2½-inch pots, \$5.00, and 3½-inch pots, \$7.00 per 100. Jasmine multiflorum 2½-inch pots, \$3.50 per 100. Bourdiana Beckii and Cleveland, 2½-inch pots, \$3.00 and 2-inch pots \$4.50 per 100. Albano Hendersonii, from 2½-inch pots, at \$7.00 per 100; from 1½-inch pots, strong plants, \$1.10 per dozen, or \$3.00 per 100.

Terms, cash with order or satisfactory reference.
FRANCIS MORAT'S SONS & CO.,
LOUISVILLE, KY.

Three new American Seedling Chrysanthemums, raised by Mr. Wm. Scheldrick.

GOLDEN BEAUTY, a splendid grower, of dwarf, stocky habit making the pot plants, Chinese type and of the richest golden yellow, most probably the finest yellow in existence. 25 cents each; \$2.00 per dozen.

PURITIFERA, a colossal grower, making fine show plants, flowers of medium size, very numerous, of perfect form and beautiful purple; a scarce color, therefore very welcome. 25 cents each.
RED FIELD, a distinct novel variety, of vigorous growth, dwarf habit, single pompon style, very pretty, flowers abundant, beautiful cherry red with yellow center. There is nothing like it. 35 cents each; \$4.00 per dozen.

A few thousand of the choice older kinds still on hand. \$2.00 per 100; \$15.00 per 1000.

Address **J. C. GIBSON, Woodbury, N. J.**

W. T. BELL, Franklin, Pa.

F. R. PIERSON & CO.,

Tarrytown, New York, U. S. A.,

ORIGINAL AND LARGEST GROWERS OF

Lilium Harrisii Better known as The Bermuda Easter Lily

The Best in the World for Forcing for Winter Flowers.

WE OFFER ONLY STRONG FIELD-GROWN BULBS FROM OUR OWN GROUNDS IN BERMUDA.

THIS VALUABLE LILY IS OUR SPECIALTY.

We grow the bulbs by the acre on our own grounds in Bermuda. We were the first to grow it in large quantities and to offer it at reasonable prices, and we have always been recognized by the trade as

HEADQUARTERS FOR THE BERMUDA EASTER LILY.

Supplying the trade as we do both in this country and in Europe, and we hold by far the largest and the controlling stock of the genuine variety in the market.

The extent of our operations in this bulb alone will be best understood when we state that we expect to sell from OUR CROP of 1890, over a

HALF A MILLION BULBS.

Be sure you get the genuine Lilium Harrisii. In order to secure "the true variety," purchase your bulbs from original stock, which is known to be pure. The value of this Lily has led unscrupulous or ignorant parties to plant L. Longiflorum in Bermuda, or grow it there one season and send it out as Harrisii, and dealers should look with suspicion on bulbs offered at prices less than market rates, as the supply has never yet met the demand: "Mixed Bulbs" only being offered at reduced rates.

This is not only the best by far of all lilies for winter blooming, but it is one of the most profitable flowers that can be grown by florists. It is very easily handled, and the flowers being especially effective for decorative purposes, always command large prices. From its name some have thought it was a bulb for florists' use for forcing for the Easter market only. This is not exclusively so; it derives its name from the fact that in Bermuda, grown in the open ground, it blooms at Easter time—hence the name "Bermuda Easter Lily"—but by growing it in this country in the greenhouse, with successive lots, it can be had in bloom all the winter from early in December until after Easter; in fact, by special culture, all the year round, or as long as cut flowers are in demand. The fact that it can be forced into bloom by the Christmas holidays adds particularly to its value, as it fills in at a time when flowers are usually scarce and in great demand at high prices, but to accomplish this the bulb must be potted early in August, something depending upon after treatment and temperature the bulbs are grown in.

For this purpose our Bermuda-grown bulbs are indispensable, as in Bermuda the bulb reaches its highest development, and ripens off perfectly, and is ready for shipment usually by the middle of July—before bulbs in our own country have hardly begun to make their growth. Our bulbs being grown in the open ground, in a climate naturally adapted for their perfect growth, are particularly strong and healthy at any time.

New Crop will be ready for delivery early in August. Orders booked for delivery at that date.

Large growers or dealers in this bulb should write us for special prices, stating quantity of bulbs desired, and we will give lowest estimate on the same by return mail.

F. R. PIERSON & CO.,

TARRYTOWN, NEW YORK, U. S. A.

New York.

The bedding trade is still very good; those who have an extensive experience in this line say it is an unusually successful season. Owners of country places are spending very freely in their embellishment. There is a continually increasing taste for fine shrubs and ornamental trees. A great many rhododendrons are being planted, though they are less popular with small buyers, who seem to regard them as expensive. There is an increasing interest in hardy plants, when laying out a country place. Bedding out in the city itself is comparatively small, however, as people now go out of town very early in the season.

Kalmia, magnolias and ox-eye daisies are all over the streets now, being sold by the bushel.

As for the flower market, at this season there are really notated and fixed prices. The excessive heat has made stuff both poor and plentiful, while, if there was a week of cold weather, stuff would probably be scarce. It is a pretty hard matter to quote prices, when we hear of roses selling for \$5 a 100 and \$5 a 1000 the same day. 35 cents for Beauties sounds well for June—but you can buy some of them for 5 cents as well as 35, and prices are just as fluctuating for all kinds of stuff.

A good many big peonies are to be seen in the market, both pink and white. Among orchid blooms, the finest now in are Cattleya gigas, of which Siebrecht & Wadley have a quantity of specimens.

Some of the plant importers who object to the McKinley bill intend to visit Washington to state their objections before Congress. The time when they will be given a hearing is not yet decided upon.

E. L. T.

A New Pansy.

"You have all varieties of pansies, I suppose?" he remarked, as he entered a florist's store. "Yes, sir." "Let me have some chimpanzees, please."—*Pittsburg Chronicle.*

SAN FRANCISCO, CAL.

Fumigators.

I see by the June number of your paper that some one asks for a good fumigator. After twenty-five years experience with all fumigators of the country, I think I have made one myself which is a success. It is at least a great comfort to me if not to the greenflies. With this I can fumigate five houses 100x20, in 40 minutes. This fills the houses so full that you can not see far in front of you and fumigates so quickly that the smoke does not get hot; therefore it will not injure the tenderest plant. Even heliotrope will stand it.

I will now try to give you a full description of my arrangement. A year ago we had a car load of Portland cement come into town in iron casings in the form of barrels, with two heads of wood. After these barrels were empty I knocked out the wooden parts, leaving the iron cleats at the sides, and then cut a false bottom of sheet iron, which rested on those cleats, cut a round hole in the side about three inches in diameter, for vent. Two small handles were put on the side with which to pull it, and two runners on the bottom so that it will run something after the style of a sleigh. Then I have a follower perforated with holes, to put on the top of the tobacco stems should they burn too quickly, otherwise it is not wanted.

This is what I call a perfect fumigator, and the whole cost was fifty cents and two hours' labor. Some of my brother florists may laugh at this, but if they doubt the truth of the statement I will show my device to them at any time.

At first start a small fire in the bottom and gradually fill until about 50 pounds of stems are put in. After one house is fumigated, before going into another I rake out some of the hot ashes. The stems will then burn as if they are just started. This I do until all the houses are full. Another point is that it leaves no dirt.

I am so well satisfied that if I could not make another like this I would not sell it for ten dollars.

St. Albans, Vt. HENRY BRYANT.

DID YOU SAY

You have not tried HUGHES' SOLUBLE
FIR TREE OIL,

And that you want an effective Insecticide, then do what other florists of experience and wisdom have done before you, and order at once a trial gallon. Read the previous numbers of the Florist to find out what it will do. Dozens and dozens of American testimonials have confirmed what I claim for it.

Stevens' Florists' Refrigerators

These are the only ones made that will
keep Cut Flowers perfectly.

The Reason:

Because the temperature is always even.

The air is perfectly dry.

They are never cold and warm, as the ice may be
melted or little in them.

This is why they do their work perfectly.

They take but little ice, and no care.

GEORGE HEINT, Esq., the leading florist of Toledo,
under date of March, 1891, says: "The florist re-
frigerator you put in for me two (2) years ago has been
in constant use summer and winter ever since.
Keeps cut flowers nicely from three (3) to seven (7)
days, can then be taken out and will keep as well as
ever. Uses but little ice. Cost me less than four
dollars (4) the hottest month. It will pay for itself
easy in the stuff it will save in one season. I would
not be without it for double its cost. I never lose
any flowers, as they keep until sold. Resp't."They are ornamental, can set in any place.
Have glass doors in front to show goods.
The style and workmanship can be de-
pendent on. Circulars sent on application.

COLD STORAGE FOR BULBS, ROOTS, ETC.

RECENT LOSSES paid by Florists' Hall Association: The John A. Salzer Co., La Crosse, Wis., \$41.63; J. W. Losey, La Crosse, Wis., \$28.54; D. M. Briggs, Avoca, Ia., \$15.66; L. C. Chapin, Lincoln, Neb., \$40.35.

FROM a daily paper we learn that among the changes made in the McKinley tariff bill by the Senate Finance Committee "The free list is lengthened by the addition of orchids, lilies of the valley, azaleas, palms, and certain other plants."

OUR CONVENTION SUPPLEMENT will be published with the issue of August 15, and the map and directions it will contain will, we believe, be of considerable value to those attending the meeting at Boston. Exhibitors wishing to call special attention to their exhibits will find the supplement a very effective medium.

Long Island Notes. BY WM. FALCONER.

A BAD COMPLAINT.—Dyspepsia when the strawberries are ripe.

MAKE HAV while the sun shines, but don't forget to run the cultivator between your growing crops.

SOW SEEDS of calecolarias, cinerarias and Canterbury bells for next season's flowers.

THE "rogues" must be routed. If you save your own seeds of anything be sure you pluck up and discard every plant bearing inferior flowers as soon as it comes into bloom.

THE NARROW-MINDED florist doesn't think much of this plant or of that one, simply because he has never grown either of them well. But there are other florists and other opinions.

RAISE SOME young chrysanthemums. Take fat, fleshy tips and make cuttings of and strike them now, then grow them on in pots, and I think when next November and December come you won't repent it.

STAKE YOUR chrysanthemums if they need it. I use one stout stake to each plant, and I find it pays to apply the stakes before they really are needed, rather than wait till the plants kneel over before staking.

STAR of Quedlinburg phloxes this year show as great a variety in coloring as do the flowers of an ordinary Drummondii grandiflora strain.

EVERLASTING PEAS are not fragrant, hence their unpopularity, but as they are hardy herbageous perennials, long-lived and perfectly hardy and bear a great profusion of handsome rose-purple or white flowers, florists should grow a lot of them, especially of the white one.

TEN-WEEK STOCKS.—From sowing time in March till blooming time in June is only about three months; this might lead us to think that in three months we can get ten-week stocks in good condition at any season of the year, but this is not so according to my experience. I never have had good ten-week stocks after midsummer, no matter when I sowed them.

"AMARANTHUS MARGARITAE" may please some folks, but it does not please me.

DOUBLE PETUNIAS.—If you want the largest possible flowers plant out your petunias, but the best wood for striking is had from pot plants.

SPOTTED MIMULUSES.—Odd but strikingly beautiful flowers and now in their heyday. Only for pot or garden decoration; of little use for cutting. Although the seeds are very small they have great vitality and are almost sure to grow. Sown in March, planted out in rich moist ground in May, in bloom in June, cleared off in July and succeeded by mignonette for fall use.

THE PINK CATCHFLY (*Silene Armeria*) from self sowings of last year is in bloom and a very pretty annual it is. Apt to become somewhat of a weed in spreading about, but never in oppressive quantity.

SWEET WILLIAMS are in all their glory. As garden flowers they are effective and desirable, but for cut flowers nobody seems to want them, they are too bunchy.

GALLARDIA GRANDIFLORA in many varieties is in full bloom and bright in the garden and in demand for cut flowers. It is quite hardy, a good perennial, easily raised from seed and long lived.

TIERMOPSIS CAROLINIANA is a little past its best. Good clumps of it are quite telling in the garden, and if to be had in large bunches it would be desirable for cut flowers, but its tall spikes of soft yellow lupin-like flowers are only effective when used in bunches.

HARD PAN.—Although we have a host of hardy plants now in bloom, when it comes down to naked facts only about half a dozen are asked for particularly as cut flowers. They are Canterbury bells, poppies, foxglove, *Coryopsis lanceolata*, the later peonias and the earlier Kämpfer's irises.

COSMOS BIPINNATUS.—I have found that so far as earliness in blooming is concerned it doesn't matter much whether I sow in March or June, both begin to bloom together and about the end of September.

HELIOPSIS LEVIS is a hardy perennial, a small sunflower, and pretty enough, but such a pest. Its seeds ripen abundantly and get scattered about and germinate in great quantity, and not only in the empty spaces between the plants, but also in the very crown of plants. Root it out.

LILUM HANSONI is one of the choicest of our Japanese lilies and high priced. A curious fact about it, however, is that we have no fully native or exotic that grows more vigorously or keeps healthier than it does. We have clumps of it in the shrubberies with 30 to 50 stems in each, and the stems 3 to 5½ feet high and carrying 7 to 17 flowers apiece. But notwithstanding all this coupled with its hardiness, earliness and fragrance, I think its beauty is overrated. It never seeds with us.

THE GOLDEN ALYSSUM (*A. saxatile*).—I have just gathered the seed and will sow now for strong blooming plants for next spring. Although it is a perennial it is well to raise a fresh lot of plants every year.

THE DOUBLE FLOWERING sweet alyssum makes a real pretty border and scents the atmosphere all about it, but if we wish to have it as compact and pretty in the fall as it now is we have got to cut it in a little.

THE DOUBLE FLOWERING White Weed

(*Chrysanthemum Leucanthemum semiduplex*) came to us recently from Europe with great hurrah. What a ragamuffin wretch it is. In general appearance, habit and freedom of growth this new comer is the counterpart of the typical form, but while we all admit that the flowers of the pernicious White Weed are pretty, few will deny that this semiduplex variety is other than an ugly renegade.

CHRYSANTHEMUM MULTICAULE has been in bloom for a month and it is still spreading in body, multiplying in buds and increasing in attractiveness. It is a pretty little golden flowered annual from South Africa, and a novelty this spring. But notwithstanding its profusion it is of little use for cutting, hence will hardly become as popular as *Drummond phlox* and other annuals that are useful for cut flowers.

CHRYSANTHEMUM LACUSTRE and *C. latifolium* are, I presume, used to designate the same plant; anyway it is a good plant and now in full bloom. The flowers are very large (on our plants as much as 3½ inches across), white, daisy-like, solid and full formed. The plants are 2 to 3 feet high and branched, and the flowers occur singly terminating the main and lateral shoots. The flowers, although large and showy, are stiff, and I don't think abundant enough to make it a desideratum for florists to grow in quantity for cut flowers. It is a hardy herbaceous perennial.

ANTHEMIS, double yellow *Marguerite*, is the name that occurs on the New York auction bills for what Robert Craig, in the *FLORIST*, page 303, February 15, 1888, figures and describes as *Anthemis coronaria* fl. pl. Planted out in summer it is one of the most generous blooming plants we have, of compact but vigorous habit, and always in bloom. Well worth growing for summer yellow flowers and a good deal cultivated for winter blossoms. Easily increased from cuttings.

LEMON VERBENAS wintered in a cold frame. Last fall I lifted a lot of plants that had been planted out over summer, cut them in a good deal and heeled them in pretty close together in a deep, cold frame. They lived all right, and in spring I set them outside again, and they now are growing as vigorously as can be and absolutely clean.

THE "New Miniature Dwarf Sunflower" (*Helianthus cucumerifolius*) from seed sown indoors in April, and the seedlings planted out about the middle of May are just beginning to blossom. Each plant has a stake to itself to keep the wind from breaking its branches, but in field culture this is not necessary. These plants will bloom in good condition till mid-July strikes them in August, and then they will be succeeded by young plants now an inch high. Young plants do not mildew. For cut flowers they are capital, so bright and so abundant, and as the flowers are of small size they have none of the coarseness or stiffness peculiar to the big sunflowers.

MOST of our white birches have been seriously injured during the past winter and fully half of their spray is dead. The fern-leaved varieties have suffered most, Young's Weeping next, and the purple leaved the least of all. But I have no doubt location and other local circumstances had a good deal to do in the matter. Other species of birches have suffered no apparent injury. And I am informed that this birch-killing is pretty general in the east this season. The white birches at Boston have suffered

severely, and Supt. Parsons, of Central Park, New York, tells that not only have the large trees in the park suffered but most all of the young ones that were planted last winter have been nearly killed.

SYRINGA JAPONICA, the tree lilac, is now, June 17, in full bloom. The panicles are immensely large and the flowers small, creamy white and fragrant. It is no exaggeration to say that each panicle just now contains about 100 rose bugs, thus materially robbing us of the pleasure of having this noble species in such fine condition.

ROSA RUGOSA VAR. *MADAME GEORGES BRUANT*.—This is a hybrid raised by Bruant. *Rosa rugosa* was the male parent and the female one was the Bourbon tea *Sombreuil*. In its foliage and spiny stems this new comer bears a close resemblance to *R. rugosa*, but the foliage isn't as good and the habit of the plant isn't as compact. The flowers are white, sparsely double, decidedly tea scented, and borne in terminal clusters, but they open only one at a time in the clusters and not all together as we find in some other roses. As an ornamental shrub in the way of habit and fine foliage it is not as good as *rugosa*, as cut flowers its blossoms do not amount to much, and as a garden flower it certainly is not as good in my eyes as the plain *Rosa rugosa alba*. Judging, however, from its behavior here, I should say it is hardy enough, also quite vigorous.

HARDINESS of *Nelumbium speciosum*, page 550.—That depends. It certainly is hardy with Mr. Sturtevant. If the roots are well established in the pond and deep enough under the surface of the water never to come within the reach of ice, they will live over winter well enough. But if ice ever reaches them it kills them. And they are harder in sunny waters than in shady pools. I have also found that the yellow water lily of Florida, namely, *Nymphaea flava*, likewise the South African *Aponogeton distachyon*, are hardy in the same way.

New York Notes and Comments.

At this season there is much building and alteration going on which, with the fresh planting, makes the establishments of most growers very full of occupation. There is much new glass going up here and there around New York, and judging from the brisk sales reported planting must be quite extensive. Looks as if there would be plenty of hybrids next winter, and the growers are hoping earnestly for a drier season than last year, as then the continued wet weather prevented a proper ripening of the wood, naturally resulting in an excess of blind shoots. Speaking of hybrids, Mr. Chas. P. Anderson gives as his emphatic opinion, the fact that the best hybrids for the New York market are without doubt Mme. Gabriel Luizet, Merveille de Lyon, Baroness Rothschild and Magna Charta. He speaks of Merveille de Lyon in terms of exceptionally high praise, as the most beautiful and satisfactory rose of its color. Another hybrid of which he speaks very warmly is Prince Arthur, a rich crimson similar to Jacq, but really better in color; it comes in earlier than Jacq and is a better keeper, seldom turning blue in tint after cutting. This rose, though introduced several years ago, seems little known in the trade, though there is room for first class and satisfactory crimson.

During a recent visit to the John Henderson Nurseries at Flushing the climbing

Perle was especially noted. It is assuredly a very strange freak. Apart from its climbing it is a vigorous Perle in every respect but one, it invariably has seven leaflets instead of five, as the original. The foliage is very strong, in fact the whole plant is full of vigor, color of the young shoots very red, the flowers are regular Perles, but usually a trifle larger than the average. It is always in flower and that is one very strong point over the favorite Niel. This rose will certainly make a grand show in any house where there is space for a climber.

Among small roses here, Mme. Falcot is regarded as one which pays very well, the flowers are small but sell readily, as they show up a lovely clear yellow at night, and so many yellow or buff roses only look a dingy white by gas light. Falcot is quite prolific too, and for the last season at least, it seems to be regarded as a fancy rose. Similar in class is Watteville, but though this has been very popular it is thought likely that it may decline in favor, as many of the fancy roses do. It takes several seasons before a grower feels fully conversant with a new rose and up to all its little tricks and peculiarities, and it is rather annoying if it goes out of fashion just when he knows it all the way through.

As to Meteor, it must be satisfactory or Mr. Anderson has faith in it, for he is filling a house with it. It seems to be in flower just all the time; of course it was always regarded as a good summer rose, but experience last winter shows its value for winter blooming too. The color is exceptionally brilliant, even under a burning June sun, it seems, however, that the rose always demands a high temperature. It is grown very little, comparatively, around here; it was felt to be rather a disappointment at one time, simply because no one knew just what it wanted. We may yet come to say the same of Wootton, though such an idea will seem sufficiently doubtful to those who have tried it.

Looking at some of the hybrids, Mr. Anderson pointed out the difference between plants of English and Dutch growth; the Dutch growers have a way of working them on such a tall stock that the plant has a very awkward, high-shouldered look, apart from other objections. The English plants are always preferred.

Naturally roses take the lead at Flushing, and there is an abundance of fine stock, but a lot of chrysanthemums may be noted. No extensive stock is carried for trade purposes, they are grown purely for cut flowers, and are all the strong, large-flowered sorts, like R. Bottomly, Mont Blanc, President Arthur, and so on. In good chrysanthemums the market here demands large, fine flowers on long stems, with good foliage; exactly the same rules apply to them as to roses. Of course an immense quantity of chrysanthemums which do not fill these conditions will always be sold, but these are high grade flowers. When you hear of chrysanthemums selling for the same prices as large roses, you may be sure that they are these high grade flowers, occupying the same relation to others of their class that the Beauty does to smaller roses.

At Bayside, L. I., J. H. Taylor is increasing his already large place; eleven new houses are in process of construction, but the actual gain in number will be nine, as two old ones are to come down. One new range of ten houses presents some new features; they seem likely to be a very useful style. In size they are 20x53

BASKET OF ROSES AND SNOWBALLS.

and they are glazed with the idea of securing extra ventilation. The upper half of the span, on either side of the ridge, is glazed in ordinary fashion, with five ventilators on either side, while the lower half is made of removable sashes. When the sashes are off and the ventilators open it is practically a roofless house, but it is very much stiffer than sash only, as well as more convenient. These houses are intended for chrysanthemums or hybrids planted out; there are no beds. Steam heat will be put in. Some are already planted with chrysanthemums, which are apt to suffer from the excessive rain even so early as this.

Mr. Taylor has been planting a house full of *Hoste* in fine condition; this is another of the roses which seem likely to attain very great popularity. Meteor, too, is to be planted here more extensively. Cusin, which was always an exceptionally fine rose with Mr. Taylor, was a great success during the past season, and is still showing good blooms. Among small roses Mr. Taylor puts *Papa Gontier* very high as a paying flower; it has always flourished with him and is very prolific; there is no question of its value when properly grown.

At both Flushing and Bayside the new houses are so exceedingly light—as a rose house always should be—while strength is secured by the use of iron in the construction. Instead of cumbersome sup-

ports the roofs are stiffened by iron purlins across the sashes, bolted in place by iron knees; with the iron braces across the house the maximum of strength is secured, with the smallest possible obstruction of light. Construction has improved surprisingly within two or three years.

EMILY LOUISE TAPLIN.

The Barlow Plant Sale.

At Glen Cove Landing, June 6 and 7, the greenhouse plants belonging to the estate of the late S. L. M. Barlow, Esq., were sold at auction by order of the executors.

Elsinore, the Barlow property, is one of the handsomest on the north shore of Long Island, and the greenhouse establishment the most spacious and pretensions private one on the same coast. The glass houses are roomy structures and consist of palm house, orchid house, rose houses, compartments for miscellaneous plants, vegetable forcing houses, early and late vineries, pine apple house, violet house, etc. And as the place had been in full running order for many years and Mr. Barlow was passionately fond of flowers and plants and continually adding to his store, much interest was centered in its breaking up. The plants were duly catalogued and advertised and disposed of in a two-days' auction sale, upon the premises. Miscellaneous plants were dis-

posed of on the first day, and the orchids on the second day.

Palms in pots brought large prices, and miscellaneous plants from 10 cents to \$2 each, a few sold for more and many for less. Azaleas from 10 to 30 years old were sold for 15 cents each; cactuses from 25 cents to \$7 each; nymphæas for \$1 a tub, etc. Fruiting and succession plants of pine apples fetched 75 cents apiece. The orchids ranged from 2 cents to \$3.25 each. Stanhopeas went for 10 cents, *Cymbidium eburneum* for 15 cents, *Cataclysus* 20 cents, *Angraecum "superbum"* 20 cents, *Laelia purpurata* \$1.50, *acincta* 5 cents, *Laelia harpophylla* 10 cents, *epidendrums* 2 cents, *Dendrobium Wardianum* 10 cents, *Vanda teres* 15 cents, and *Phajus grandifolius* for \$1.50. Some plants of *Percesteria elata* throwing up flower spikes brought \$3.25 each. These prices may seem ridiculously low for orchids, but it was the general opinion of the florists present, that with very few exceptions, both orchids and the other plants brought all they were worth.

Camellias, palms and some other things that were planted in beds in the houses were too large to meet with favor. The finest specimen plant sold was a magnificent cycad in a large tub. It had a clean trunk about 6 feet high and 24 or 30 inches around, and a massive crown of old leaves and another of young leaves some 6 to 7 feet long. Siebrecht & Wadley bought it for \$50, which price was nearly three times as large as what was paid for any other plant at the sale.

The naming of the plants was deplorable, in fact, the florist buyers renounced the catalogue names altogether. A few instances of misnaming: *Crassula lactea* was sold as *cheverius*, *Cereus Peruvianus* that reached to the top of the palm house, as *C. giganteus*; *Odontoglossum grande* as *Dendrochilum filiforme*; some weedy *maxillaria* as *Disa grandiflora*, *Dendrobium moschatum* as *D. scutell*, and so on. I really believe if a little of the steam of "Education for young florists and gardeners" were turned upon us old chaps it wouldn't hurt us.

But the unique feature of the auction was the disposition of the pots. The pots in which the plants were growing were not sold with the plants but separately, and it was amusing when A. B. bought the plant and C. D. the pot. And it often happened that the pots fetched a great deal more than did the plants that were growing in them, for instance, some sawn palm would be knocked down for 25 cents, and the pot it was growing in for 50 cents. This pot business gave rise to considerable growing. Some of the practical growers, however, perceptibly refused to buy or accept of the pots at any price. And it was an amusing sight when the plants were being delivered after the sale to see the workmen kick the pots off from the plants they had hugged so closely for a dozen years.

W. F.

Orchid Names.

In a paper read before an English society by Mr. Shirley Hibberd he says: The raising of hybrid orchids has brought about a curious crisis in botanical nomenclature. The binomial system may be said to be nowhere in face of the new array of facts. Take a few examples. I will begin with the actual *Cymbidium eburneum*-*Lowianum*, *Cymbidium giganteum* and *Cymbidium pendulum*. Then I will effect a cross between *Cymbidium giganteum* and *Cymbidium pendulum*, and the selected offspring shall be called *Cymbidium giganteo-pendulum*. This

last I will cross with *Cymbidium eburneo-Lovianum*, and the result shall be a beautiful orchid with the interesting name *Cymbidium eburneo-Lovianum-giganteopendulum*. And again we have *Dendrobium Wardianum-aureum*, and we have *Dendrobium crassinode Wardianum*. I will cross these and secure a new beauty to be called *Dendrobium-aureo-crassinode-Wardianum*. We shall have to manipulate generic names in an equally elegant manner; we cross *Laelia* with *Cattleya* and obtain a new genus to be called *Lelio-Cattleya*, and we cross in an opposite direction to obtain *Cattleya-Laelia*. The broad gauge man will take the hint to keep garden varieties apart from species, and to make more sort of genera than to allow of such barbarities. To him it will suffice that the new genus has no existence as such, because the parents were necessarily not generically distinct; and you do not need that I should add that, however convenient the distinctions between *Cattleya* and *Laelia* may be, they have not the force of dividing lines for scientific purposes. The orchidists are endeavoring to turn the world back to what we may speak of as pre-Linnean times, and they substitute descriptions for names, and where a definition is wanted they provide a confusion. In passing through a village the other day I halted to light a cigar and the voices of children arrested my attention. I heard one speak in a pretty manner a bit of rhyme apparently designed to puzzle a Scotch metaphysician, but it appeared to me to fit nicely to the new problem of the identification of an orchid. The rhyme ran thus:

Supposin' I was you,
And supposin' you was me;
And supposin' we all was somebody else,
I wonder who we should be.

Seasonable Notes.

Now that the planting season for next winter's crops has arrived no time should be lost in preparing the houses to receive them. This is an important item in their management—where the previous crop has not been kept clean “doubly so.” In all such cases it is well to shut the house up tight during the heat of the day, burn a good lump or two of sulphur in it, and allow it to remain closed for two or three hours, this will destroy every insect in the house at the time. Before doing so, however, all the old soil, rubbish, etc., should be thoroughly cleared and swept out. After fumigating it is well to mix up some lime wash made by slaking some fresh lime; with this give the entire benches, inside walls not painted, etc., a good coat; this serves a double purpose of helping to destroy any fungoid growth and as a preservative of the wood, besides giving the house a clean and neat appearance.

After this is done prepare the house by placing sod, grass side down, over the cracks; then put the desired amount of soil in; prepared as per former instructions; when this is done measure off the distances you wish to place the plants apart and proceed to plant them; make the hole large enough to receive the ball,

but do not bury it but a trifle deeper than it was in the pot, fill the loose soil in round about the young roots, taking care not to break them, then press it quite firm and if the surface is flat press the whole soil quite solid as soon as planted, but when the benches are made sloping as I have formerly recommended in this paper it is well to form a slight basin around each plant at the time of planting, pressing the soil near the plant quite firm, but leaving the balance somewhat loose, this permits the early weed seeds to start into growth and they can then be cleaned off much more readily than otherwise.

After three or four weeks the soil can be raked over smooth and the whole pressed quite solid, then a very thin mulching of well decomposed manure (not more than half an inch) can be spread over the entire surface of the soil, this will of course stimulate the plants into active growth and in this condition they should be kept, pinching off the buds as fast as they show till the time comes when they are wanted to bloom. This of course will vary according to locality, strength of plants will also enter very materially into consideration here. From October 1, a fairly safe guide to follow when the object is to get as many as possible at a certain time is to allow about six weeks. If the plants were good strong healthy plants from 3 or 3½-inch pots when planted, say early in July, a fair crop of bloom could be taken off during the first two or three weeks of October, and then another good crop be had for Christmas; but if the plants were any smaller at the time of planting than the above it would be very poor policy to attempt to get a crop from them so early in the season, as cutting even one or two leaves with each bud when the plants are so small simply destroys the chances of the next crop till the plants have had time enough to recover and make stronger growth.

Many growers make a great mistake when they try to make a small plant produce what a large vigorous one can only be reasonably expected to do, and if they would only put the thing to a fair trial side by side in the same house, keep a correct account of the production of each class of plants, they would soon find that it would pay them well to give a little more attention to the quality of the stock they plant in the future. Of course after treatment will always be a great factor in all these cases, for no matter how good the plants are when newly planted if they are not well cared for all the time they will not produce the desired result.

Shading. We are often asked if we shade our young plants in hot weather when first planted. To all such I simply say no; neither do I think it necessary for a rose house newly planted, on the contrary, we find the best result from them when we get bright clear weather to give all the air possible in conjunction with the clear sun light, this keeps the plants sturdy and the wood solid, and consequently in much better condition to stand a long winter's work than if soft and tender growth is permitted during the summer.

JOHN N. MAY.

Summit, N. J.

“Hardy Perennials in Nursery Catalogues.”

Apologies of your correspondent's remarks, page 538, that it is doubtful whether nurserymen could compete with regular growers who make such plants a specialty. Let us see. Nurserymen deal largely in hardy ornamental trees, shrubs,

roses, vines, fruit trees and the like, they appeal to the multitude and through their agents penetrate to the most unfrequented parts of our country, reaching a class of customers who never would buy plants if not personally solicited to do so. And while the men folks want the trees and vines and berry bushes, the women want some roses and pretty shrubbery. And what can associate more aptly with these plants than hardy perennials such as pæonias, larkspur and day lilies? If they can not be had from the nurserymen and at the same time as the nursery stock the chances are hosts of people who might gladly buy these hardy perennials will go without them.

Now, what say the nurserymen? Ellwanger & Barry run a large general nursery and also a large hardy perennial department; Thomas Meacham & Son do the same; Hoopes Brothers & Thomas are extending their herbaceous department, and Mr. Josiah Hoopes told me a little while ago that they had the demand for perennials increasing greatly; Temple & Beard run a general nursery and are exerting themselves vigorously in the hardy perennial line; and J. W. Manning, also a prominent nurseryman, gives critical attention to hardy perennials. All of these firms issue tree catalogues and bear special stress upon their hardy herbaceous perennial department. If it didn't pay them they would have given it up long ago, that's business.

Many nursery firms, however, have never gone into the hardy perennial business either as a specialty or as an auxiliary to their tree trade, hence can hardly be expected to comprehend its capabilities. They can scarcely urge if there was any great demand for these plants they would have felt it, for nursery agents do not encourage the sale of any plant or class of plants not included in their lists; besides the mass of buyers barely know what they want, the business of the agent like that of the florist's catalogue, is to teach them.

If every nurseryman goes into the hardy perennial business won't they overdo the thing? I have no solicitude on that score; on the other hand, I believe the more who handle these plants the greater and more increasing demand there will be for them.

But it will not pay the general nurseryman any more than it will the general florist who does not make a specialty of this department, to grow all manner of perennials. Restrict yourselves to the cream of hardy plants such as irises, pæonias, larkspur, white day lily, Japan anemone, herbaceous clematis, coreopsis, pyrethrum and the like, and the best and most serviceable sorts of these. And any person accustomed to getting up ordinary nursery stock can get up these perennials as well as can any specialist in the trade.

W. F.

California Notes.

ED. AM. FLORIST:—I send by this mail a photograph of some roses selected from among those shown at our annual flower show which has just closed. They were all grown out of doors in private grounds and without any especial care or cultivation.

Our flower show this year was a departure from former years inasmuch as only named varieties were exhibited. There were some 175 varieties of roses and the committee on nomenclature had a by no means easy task of giving names to many that were brought either with an improper name or none at all attached. Among the roses most admired, especially

TWO VALUABLE SHRUBS.

by the ladies, were the Marquise de Vivens, shown by Mrs. T. B. Shepherd, of Ventura, which here grows and blooms luxuriantly and with a great deal of color, not at all like the pretty "little" rose Mr. May describes, but quite a large and very beautiful one. There was a "Folkestone" shown that measured a little over five inches. These and the Papa Gontiers are just being introduced and are becoming very popular, especially the last, which is very hardy and thrives under all circumstances.

There is a growing interest in this state for named varieties of roses and "mums" and such shows as the one just closed will greatly tend to educate the people to a higher standard. Formerly roses and flowers in masses only were shown.

The Los Angeles flower show was held two weeks ago and was a great success financially and otherwise. The central piece was an Eiffel Tower of evergreens and callas reaching to the roof of the large hall. Then scattered throughout the room were immense banks and mounds of roses, one large circular table being devoted to the named varieties. The Raymond Company's Nurseries, of Pasadena, as represented by Mr. Hovey, showed orchids and other choice plants.

One of the show places near here are the nurseries of Joseph Sexton. He has some two acres of callas now in bloom, which are a sight to behold which you may well imagine. His carnations, of which he has nearly 500 varieties raised for seed, are worth a long journey to see. Santa Barbara, Cal. E. L. BAKER.

Two Valuable Shrubs.

The cut represents flowering branches of two most beautiful early spring blooming shrubs, *Pyrus spectabile*, fl. pl., and

Exochorda grandiflora. The flower buds on the pyrus are brilliant red in color, and the open blooms are rosy pink. The *exochorda* is pure white and as it is easily forced should be a valuable plant for winter cut blooms. Both introduced from China. W. J. S.

New Plants.

Among the new plants certified by the Royal Horticultural Society at the Temple Show were the following, the descriptions being taken from the *London Gardening World*:

LUPINUS FOXII.

The leaves of this lupin are digitate, with numerous lanceolate leaflets, corresponding to those of *L. polyphyllus*. The erect stems bear long racemes of flowers of an intense dark violet, with the upper half of the standard white. It will be an acquisition to the herbaceous border.

DELPHINIUM AUTOLYCUS.

The raceme of this, as shown by Messrs. Kelway & Son, was about 3 feet long, covered with semi-double flowers of great size. They were of an intense violet, with the outer sepals tinted with deep blue.

LASTREA FILIX-MAS CRISTATA FIMBRIATA.

The fronds of this beautiful sub-variety are spindle-shaped or elliptic in outline, with a few slender ramifications at the apex, and a crest terminating each pinna. The special characteristics of the variety are that all the pinnae are slender and narrow, while the pinnules are sharply and incisely toothed with slender teeth. The frond is therefore more graceful than those of the original crested variety itself.

ASTER ALPINUS SPECIOSUS.

The radical leaves of this aster are broadly spatulate and toothed above

the middle, while the cauline ones are linear-spatulate or linear and entire. The stems vary from 6 to 12 inches in height, and bear a solitary flower measuring from $2\frac{1}{2}$ to 3 inches in diameter with bluish purple rays and a golden yellow prominent disc.

SAXIFRAGA MCNABIANA.

The pot plants of this were about 10 or 12 inches high with the stems branching in a sub-pyramidal fashion. The flowers are large, white and richly spotted with red over two thirds of the area of the petals, with a greenish yellow eye.

PEONY CONCHIFLORA.

The leaves of this are twice divided, with oblong, obtuse segments. The flowers are single and sub-globular, owing to the broadly obovate petals being concave or incurved. The latter vary in number from 5 to 7, and are of a soft carmine-red, rather flamed with scarlet towards the base.

ANTHURUM ALBUM MAXIMUM.

This plant is a variety of *A. Scherzerianum*, with lanceolate, acuminate leathery leaves and a broadly ovate, creamy white spathe, slightly tinted with scarlet at the apex. The twisted spadix is light yellow.

CANNA, MADAME CROZY.

As grown in pots this variety is dwarf, with broad leaves of a rich green. The flowers are of great size and produced in short racemes. The segments of the perianth are scarlet and some of them are edged with yellow, while the small, central organs are yellow mottled with red.

NEW GLOXINIAS.

Mrs. J. Donaldson—The flowers of this variety are of fair average size, with a five-lobed regular lamina. The whole corolla is of an intense crimson, with the exception of a white portion spotted with purple at the base of the tube. The leaves are of moderate size with silvery veins.

Her Majesty—The leaves of this are dark green, the flowers erect and campanulate, with an unusually wide tube and comparatively narrow lamina. With the exception of a small pink spot at the base of the sinus between the segments, the flowers are pure white and very fine.

Prince of Wales—The leaves of this variety are netted with grey. The tube of the erect flowers is pink externally, but interiorly is dotted with violet at the base, passing into crimson upwards, and forming broad, rounded, crimson lobes on the lower part of the segments, the rest being pure white.

Princess of Wales—The tube of the erect flowers is pure white, the lamina pink, with a narrow rose band forming an arc on the middle of each segment. The leaves are dark green.

A New Netted Strain—Externally the tube of the flowers of this strain is white and crimson or violet in different individuals internally. The lamina also varies with crimson, scarlet and violet hues, curiously reticulated or netted with white on the base of three, four, or all of the segments.

TUBEROUS BEGONIAS.

Enchantress—The flowers of this variety are single, of good average size, and of the same type as Chatterer, but the upper half of the sepals is intensified to a rich carmine-crimson, with a large white blotch at the base of each. The leaves are of moderate width and deep green.

Henshaw Russell—Here the double flower consists of a few large and bold, rather loose rosettes of a bright scarlet.

The leaves are large and deep green. A very promising novelty.

Negro Boy—This is also double and crimson, made up of numerous rosettes with wavy segments, resembling those of a hollyhock. The leaves are half cordate and very dark green.

Rev. W. Wilks—The stems of this tuberous variety are dwarf, with closely arranged, broad, dark, olive-green leaves. The peduncles are very short, carrying the flowers almost erect. The latter are large, double and consist of a few rosettes. The petals are broad, flat and soft pink, with a darker edge, giving the flower a refined appearance.

PELARGONIUM, PRINCE HENRY.

The leaves of this decorative variety are very broad, cucullate, toothed and hardly, if at all, lobed. Both flowers and trusses are large. The petals have a broad, transverse, crimson-red band above the middle, with a white edge and base.

Seasonable Notes.

Green and black fly, spider, thrip and midew. These are the enemy in sight at the present time, and it is quite an undertaking to keep them at bay. The black fly is pretty well taken care of by our lady bird corps, but the green, or a green fly I should say, is a great pest and hard to kill. It is not the green fly that infests roses and other plants in the greenhouse, and is a deal harder to kill. Red spider will be troublesome on some plants, and thrips on all.

The best remedy I find for the fly, spider and thrip is tobacco water, made as follows: about 8 pounds of tobacco stems is placed in a wash tub, on this is sprinkled about 1 ounce of potash lye, it is then covered with water and steeped for a few hours. The stems are then stirred up and about a quart of the liquor is put to four gallons of water and the plants are either dipped in it or syringed with it every evening until clean. As prevention is better than cure, it will be wise to syringe the plants frequently with the tobacco water, though nothing of the enemy can be seen.

Midew is very injurious to many varieties and in some seasons and localities it is almost ruinous. The best remedy I have yet found is black sulphur (sulphur vivum) applied entirely over the plant with a bellows. Syringe the plants first and then put on the sulphur, be sure that every leaf is covered on the under sides, this should be followed up for at least ten days if the sulphur is removed either by rains or syringing. The midew I have reference to is the affection that comes on the mature leaves in black or brown patches and it makes its appearance when the atmosphere is murky and very moist—such days as we may expect about this season.

Keep a sharp eye on watering; when the atmosphere is surcharged with water let the soil become dry, but after the clearing away of the humidity be sure your plants are thoroughly soaked at the next watering.

JOHN THORPE.

Boston.

The cut flower trade has been quite steady and brisk all through June. There has been an unusual number of weddings and the demand for choice flowers for school and seminary graduations seems to increase considerably every year. The quality of indoor roses has not been up to the average owing to the prevalence of cloudy and rainy weather during the early part of the month, and the outdoor roses are coming in later than usual, so there has been no surplus of really good roses of any kind and customers have had to content themselves with second rate stuff in many instances. Carnations and lily of the valley are very good and in full supply. Spirea, paeonias, rhododendrons and other outdoor flowers have been brought in in large quantities. Smilax is more plenty and price lower.

The season seems to have been favorable for rhododendrons. Never before has there been such a gorgeous display of these as was to be seen during the last two weeks under the great tent at Mrs. F. B. Hayes' estate at Lexington. The place was crowded continually with visitors, the numbers running into the thousands, and the show was well worthy of the interest it excited. The plants are many of them enormous specimens and comprise the very choicest varieties obtainable. No expense has been spared to make the collection a notable one in number, size and variety, and Mr. Comley, the gardener, has been well rewarded this year for his care and patience.

The show of rhododendrons and azaleas at Mr. H. H. Himmewell's has also been superb this year, and large quantities of blooms from this place as well as from Mrs. Hayes' have been sent in to adorn the tables at the Saturday exhibitions of the Mass. Hort. Society.

The Gardeners' and Florists' Club is earnestly at work through its various committees perfecting arrangements for the reception, comfort and pleasure of its guests next August. If good intentions and earnest effort count for anything the members of the S. A. F. who visit Boston at that time will have little to complain of.

The beds in the public garden and other places are being laid out with a special view to the approaching encampment of the G. A. R. Appropriate mottoes and devices representing the various emblems of the order have been worked in with great accuracy and this feature of ornamental gardening although evidently falling into disfavor with people of taste, will no doubt give much pleasure to the general public. Large numbers of palms, evergreens and other large plants of a decorative or tropical character have been added to the embellishment of the garden this year, and this feature will doubtless give as much or more pleasure to the S. A. F. visitors as they will get out of the formal bedding. The garden will also be subjected to the scrutiny of another intelligent body of interested visitors, the Association of Cemetery Superintendents who have happily arranged to hold their annual convention at the same time and place as the S. A. F. and who will be a most welcome auxiliary no doubt in the deliberations of the latter society when the subject of "Landscape Gardening" comes up.

Mr. J. D. Reynolds and Mr. J. C. Vaughan, of Chicago, having come East to attend the Seedsmen's and Nurserymen's conventions took the opportunity to give Boston a short call. Mr. Reynolds received from the G. and F. Club at a special meeting called for that purpose,

a unanimous endorsement and recommendation for the position of Commissioner of Horticulture at the World's Fair of 1893.

W. J. S.

New York.

Mr. W. A. Manda sailed for Europe on June 21, for an absence of some months' duration.

At one of the recent auctions some of the palms sold realized rather more than the average retail price—a very good thing for the sellers. Auction prices have been very good, taken all around, this season. Some important orchid sales have taken place, but there are not so many of these as a few years ago, and the sales are very slow. In fact, most of the orchid buyers have filled up their places, and it does not look as if there were many new additions to the ranks of large orchid buyers. Trade rose sales are now in order, they are an important feature of the auction trade. A lot of stuff from Philadelphia has been sold at the New York auctions; competition is becoming quite keen between the two cities.

The flower trade is not at all brisk now, it takes a temporary spurt some days, the college and school commencements calling for quite a lot of flowers, but the main trade is over now for the season. A good deal of stuff, however, is sold at the summer resorts.

The Florists' Club has finally decided to hold an exhibition next November. Every effort will be made to render it an event of unusual interest and magnitude. The club is anxious to secure Madison Square Garden for the undertaking; since the alterations it is an exceptionally fine place for a big show. A great winter garden is one of the proposed features, carried out with a background of forest trees and evergreens. Another suggested feature is a fine tropical garden, of which there is plenty of material in the large establishments around the city. It is to be hoped that nothing will interfere with the proposed plan; New York will certainly support a flower show liberally, if it is only big enough. The public likes big things. The club expects the co-operation of many society people interested in horticulture, and will spare no exertion necessary to make a big success.

Pitcher & Manda will build nine new houses at Short Hills to be used for growing orchids, etc.

Mr. Thomas Young, Jr., and wife sailed for Europe June 21.

E. L. T.

Chicago.

The ponds of aquatics at Lincoln Park last summer proved such an attraction that two new and larger ponds have been made and planted for this season. The new ponds are located a short distance north of the old ones, in a portion of the park which has remained unimproved until recently. The Victoria regia which is now growing with remarkable rapidity in one of the old ponds was planted out April 20, the water of the pond being heated by steam pipes to a temperature of 80°. There was but little sign of growth at the surface of the water for some time and it was feared that a mistake had been made in putting out so early, but the present rapid growth shows that the plant had been gaining strength at the foundation all the time. At the head of the new ponds some elaborate rock-work is being constructed through which will be led the water that supplies the ponds, a pretty water-fall occurring in its course. A rustic bridge is

THE GATES, SOUTH PARK, CHICAGO.

also being built over the canal which connects the ponds.

The old greenhouses at Lincoln Park will be torn down this summer. Material has already begun to arrive for the construction of a new range of houses, fourteen in number, each 11x100. They will be located a little northeast of the old houses on a somewhat higher point of ground. The foundations for a handsome palm house will also be laid this summer, at the south end of the other new houses, but the superstructure will not be added until next year. Where the new houses are to stand an immense excavation has been made and this will be occupied by the carpenter and blacksmith shops and storage cellars, the greenhouses being built over the top. Concrete and cement will be freely used that no moisture may get through. The ground where the old houses stood will be terraced up to the new range, and the stately palm house will be a conspicuous object from a considerable distance by this arrangement.

Among other additions to the attractions of Lincoln Park to be made this summer is a statue of Linnæus the great Swedish botanist. It will be placed a little north-west of the site of the old greenhouses, in a conspicuous position, where work has begun upon the foundation. The statue was cast in Sweden and is now on its way to this country. When in position it will be supported by four allegorical figures. The statue is a gift from the Swedish residents of Chicago, the expense of the pedestal and foundation being borne by the park commissioners.

Superintendent Kanst has "got the earth with a fence around it" for a feature of his bedding display at South Park this season. The globe is about ten feet in diameter with the continents outlined in echeverias on a field of *Oxalis tropaeoloides*, the whole resting on a pedestal of echeverias. Around it are

short posts of echeverias with a ball of oxalis at the top, connected together by wreaths of amplexosis. It is probable that this is intended as a delicate reference to 1893. Another striking feature is "The Gates," standing some ten feet high and formed of echeverias, oxalis and alternanthera. The calendar and sun dial appear in much the same shape as last year, and the elephant which has been rusticated for several years again appears and is found resting on the green lawn as gracefully as an elephant can, especially one of echeverias. A taking feature with visitors is a roll of carpet which has partly unrolled down a grade. The pattern is very accurately worked out with various alternantheras. Then there is the butterfly, parasol, shield with the national colors, Maltese cross, lover's knot, ivy vine traced in alternanthera, and encircling all a bed of geraniums about four feet wide and half a mile long. Three ponds of aquatics near the greenhouses will soon make a handsome show. In them victorias, nymphæas, nelumbiums, pontederias, papyrus and similar aquatic plants are luxuriating. The greenhouses are gay with aehimines, begonias, fuchsias, etc., and there is a fair showing of orchids, among them a good variety of *Lælia purpurata*, and a specimen of the fragrant *Aerides Fieldingii*.

The Fuller greenhouses on Cottage Grove avenue are being torn down. This will remove another landmark of the trade in this city. The first greenhouse built on this place was erected by Desmond & McCormick about 1869; additions were made from time to time, by various owners, Mr. D. B. Fuller taking possession in 1878, since which time he has built up an excellent business there. A brick block will soon be built on the site of the old greenhouses.

The spring plant trade was very satisfactory. Stock was sold out very clean. While prices were nominally about the same as in previous years, they were

really somewhat lower, all desiring to avoid the possibility of having any stock left over, as was the case last year.

J. T. Anthony is going into orchids for cut flowers quite extensively. He has put in a large stock of plants of the kinds most useful for the production of flowers in winter. He has also gone heavily into palms and has worked up a large retail trade in these and similar decorative plants.

D. B. Fuller has purchased ten acres of land at Downer's Grove, where he will build a range of houses this summer.

The Florist Club has decided to make an exhibit as an organization at the World's Columbian Exposition of 1893.

At the last meeting of the Florist Club Mr. Alfred Saxen exhibited a good collection of pansies of excellent colors, and Mr. Joseph Curran a beautiful specimen of infant's cap. The latter was awarded a first class certificate by a unanimous vote, and an early adjournment was had to properly congratulate the exhibitor upon the event which had caused him to invest in the cap. It's a girl.

The Florist Club is the only organized body of horticulturists in the city of Chicago.

Messrs. Jas. D. Reynolds and J. C. Vaughan have returned from a trip through the east.

San Francisco.

There has never been such a year for outdoor roses. The amateur is in his glory and the recent flower show made it evident that the public interest in roses is very greatly on the increase, from San Diego and Los Angeles to San Francisco, and north to the state line. Ten years ago there were but one or two rose fairs a year in all California, but now almost every town of any size has its floral festival, where the chief display consists of roses. A single issue of one of the newspapers the other day contained notes about floral displays at Santa Paula,

Pomona, Riverside, Santa Cruz, Santa Barbara and San Diego. In all of these roses predominated.

The State Floral Fair, which has recently closed, contained great rose displays by E. Gill, one of the leading florists of Oakland, the Fruitvale Company, H. Greenough, the California Nursery Company, at Niles, John H. Sievers, and many others who are prominent in the trade.

Mr. Sievers' new rose, the "Rainbow," was shown in its full perfection. This rose is more likely to win general recognition than any other new California rose of recent years, owing to its superb shape and very unusual shade of color. The colored plates, although well done, do not begin to do it justice; the rose at once attracts the attention of every gardener, florist or amateur, and so far seems to hold its own, either singly or in masses, with all other roses grown on the Pacific Coast. It is a sport from Papa Gontier—the color comes nearest to being a light pink, shaded and splashed with darker color.

The conditions under which florists, seedsmen and nurserymen carry on their business in California are of course very different from those which prevail east of the Rockies. Many things are much easier to grow here and make much more rapid development. Of many of the hard wood shrubs, such as deutzias or snowballs, one can plant cuttings in open ground in February and have good plants fit for sale in November. A large number of kinds of roses can be handled in the same way. In fact, the use of glass for raising stock and for forcing flowers for a more steady winter supply used to be thought unnecessary in California, but of late years all the successful florists are extending their area of glass. There is not, nor ever will be, the same extent of trade in soft wood and bedding plants in California as there is east, for any one can grow them too easily. Where geraniums, heliotropes and all such plants grow "right along" all winter in the open air, the business of supplying "bedding plants" each spring is of course reduced to its smallest possible proportions.

On the whole, however, the florists do reasonably well here, as the growth in the number of establishments will show. In 1874 there were but thirty-three florists in San Francisco, and now there are seventy-two. All over the state the same proportionate development is manifest. The improvement in public taste during the past five years is still more marked; quality is more desired and better prices are paid. The daffodil, for instance, then very rare, has become the prime favorite for a spring flower; and the California wild flowers which no florist kept for sale five years ago, now fill large windows on the principal streets.

CHARLES H. SHINN.

The Fuchsia Beetle.

BY ERNEST WALKER

This is a shining black beetle with an iridescent lustrous about one-eighth of an inch long, which makes its appearance on fuchsia plants about this time in the year—coming in a great swarm in a single night. Their work is rapid and destructive.

The fuchsia is a plant with but little vitality to spare during the heat of summer, and if it is compelled to divide that little with this ravenous pest, there is indeed a small chance for their surviving the heated term.

Being of such a character these insects are rapidly telling on the florists' trade in fuchsias wherever they have made

their appearance two or more years in succession; for while the florist perseveres in spite of the odds, the amateur, his customer, gives up, deciding no more money shall go for plants with which she is sure to fail.

With the exception of arsenical preparations the writer has experimented with every insecticide, none of which have proved of value. One of the best methods of fighting the insects we found in hanging sticky fly-paper up behind the plants and scaring the insects from the opposite side. By repeating this operation every morning for a few days at intervals of a week or so we have in the past managed to save our stock plants.

This season we have decided to try growing our fuchsias under a wire cage guard, not planting the fuchsias out until the wire frame is ready and the plants can be placed securely within the protection all at once.

The insect has already made its appearance the present season at some other places around town, but none so far have been seen on any of our plants. This we attribute to our precaution of closing the ventilators at night upon the houses in which we have fuchsias.

From Prof. L. O. Howard, of the Division of Entomology, Washington, D. C., we learn that the insect is scientifically known as *Graptodera exapta* and that, in the larval state, it feeds upon the leaves of "Fire Weed" (*Erechtites hieracifolia*), and the "Evening Primrose" (*Oenothera biennis*). The swarms which suddenly make their appearance upon fuchsias in all probability develop among these plants, one or the other of which species will doubtless be found to be abundant wherever the fuchsia beetle proves troublesome.

New Albany, Ind., June 6, 1890.

Foreign Notes.

THE National Co-operative Flower Show of the Agricultural and Horticultural Association of London will be held at the Crystal Palace August 16. There are offered 825 cash prizes, in addition to silver and bronze medals and a champion gold medal. For the larger prizes the country has been divided into districts so that exhibitors from the north will not be obliged to compete against those from the south and vice versa.

A YELLOW CALLA.—Among the plants recently certificated by the Royal Hort. Society is *Richardia Elliottiana*. The leaves are spotted with white and the flower is yellow.

THE ANNUAL "Tulip festival" of the Royal National Tulip Society was held at Manchester, England, May 28. There was a gorgeous display of tulips in great variety.

THE RECENT Temple Show of the Royal Hort. Society was an unusually noteworthy event. It was probably the finest trade display ever seen in London.

ONE of the latest additions to English gardening appliances is a "fog annihilator." It is a new ventilator which has been devised with the object of excluding fog, soot and other atmospheric obstructions common to certain districts in England.

A RED *Nymphaea Zanzibarensis* is an aquatic novelty. It originated in the Botanic Gardens, Karlsruhe, and was obtained by crossing *N. Zanzibarensis* with *N. Lotus rubra*.

THE ENGLISH National Chrysanthemum Society's Centenary Festival will be held next November.

THE THIRD annual Covent Garden fete was held in the wholesale flower market, Covent Garden, London, May 21. The show of plants and flowers was unusually excellent, and the exhibition was visited by crowds of people. The proceeds went to the Gardeners' Orphan fund.

THE TWENTY-FOURTH great Whitsuntide Horticultural Exhibition of the Manchester Royal Botanical and Horticultural Society was opened May 23. There was a fine floral display which included all sections of plants in season and representations of the highest art of cultivation.

WHITE Zonal pelargonium Amy Applett is believed by an English grower to be one of the most valuable varieties in cultivation. The flowers are large, circular, pure white and last for a long time after being cut.

Frost did considerable damage in some parts of England about June 1.

THE CATERPILLAR of the Winter moth (*Chimantobia brumata*) is doing serious damage in English orchards and fruit gardens.

It is now proposed to form a federation of the numerous English Gardeners' Associations.

A PROJECT is on foot to build a large horticultural hall in London. The sum of \$60,000 has already been guaranteed.

THE ENGLISH government will be asked to assist in the establishment of an English School of Forestry.

THE ANNUAL dinner of the Nursery and Seed Trade Association took place at the Guildhall Tavern, London, May 28.

THE RECENT great Horticultural Exhibition at Berlin was a great success. The displays of decorative plants and orchids were especially praiseworthy.

FROM June 19 to July 22 inclusive over 30 rose shows will have been given in England.

THE Auckland Chrysanthemum Society of New Zealand, has affiliated with the National Chrysanthemum Society of England.

A FUND is being collected for a memorial to Rozel.

THE Agri-Horticultural Society of Madras, India, held its annual flower show in the Botanic Gardens, February 22. There were many exhibitors, both native and European.

It is proposed to hold a show of pinks at Manchester, England, July 19.

CHRYSANTHEMUM Grace Attick, an American raised seedling, was awarded a first class certificate by the Royal Hort. Society last September, and an English gardener thinks the award was well deserved.

ROSE THE QUEEN received a Horticultural Certificate at the exhibition of the Royal Botanic Society May 14. It is a pure white sport from Souv. d'un Ami.

Growing Pansies.

To grow these beautiful bedding plants to perfection requires some skill. Nearly every one can sow the seed and get fair to good plants, but when the plants are ready to transplant the work is only begun. How to have fine healthy plants when blooming is the subject of this article, as this is the great desideratum in pansy growing.

I have grown them in good rich soil with fair success, but this year I tried an experiment, with such success so far that I hasten to give it to the FLORIST, so that

others may if they wish try the same plan. For experiment I took a box about 14 by 16 inches and 2 inches deep, then got some fresh stable manure that had been spread on the garden and had received about two days rain on it and put it in the box and pressed it until I had one inch of pretty solid manure, then filled the box with good rich soil and set my plants in it. They did fairly well until the roots struck into the manure when all at once they took a start and in an incredibly short time I had a mass of rich bloom. During a recent hot dry spell I placed the box in the sun, where the air could pass freely around and underneath it and dry it out quickly, and even while undergoing this trying ordeal I only had to water them every other day to keep them in fine order.

For bedding in dry localities an excavation 6 or 7 inches deep may be made and filled to one inch of the top with spent hotbed manure (packed solid), on this place an inch of rich soil, set out your plants, water well until well started and watch the result. In moist localities a mound may be made if desired, but if so the soil underneath the bed should be dug or spaded deep before the bed is made, this will help to drain and also hold moisture; on this spread the manure as above 5 or 6 inches deep and proceed as above stated. ELLIS THOMPSON.

Burnside, Ky.

News Notes.

SACRAMENTO, CAL.—The California State Fair will be held in this city September 8 to 20 inclusive.

BEDFORD, MASS.—Temple & Beard, of Shady Hill Nurseries, Cambridge, have a large nursery under way here.

AURORA, ILL.—Hail—or rather chunks of ice—fell during a recent storm and smashed several hundred dollars worth of glass on the greenhouses of W. L. Smith.

SHIREMANSTOWN, PA.—Prof. Samuel B. Heiges, of York, Pa., and Henry S. Rupp and his son, Geo. H., of this place, will sail July 15 for a two months tour in Europe.

RALEIGH, N. C.—A destructive hail storm passed a little to the west of Shelby, N. C., the afternoon of June 13. The hail stones were two inches in diameter and greatly damaged crops.

TRENTON, N. J.—The third annual exhibition of the Inter-State Fair Association will be held here September 29 to October 3 inclusive. Premiums to the amount of \$355 are offered for plants, flowers and floral work.

WESTBURY, N. Y.—Mr. T. Griffin, of tuberous begonia fame, has been engaged as gardener to Adolph Ladenburg, Esq., and is now busy remodelling and extending the gardens. Particular attention is being given to hardy perennials.

HUNTSVILLE, ALA.—Mr. James R. Schrimshaw has created a deal of wooden ornamental rustic work in the pleasure grounds of Col. Jas. F. O. Shaugnessy. This work consists of bridges, fences, summer houses, gateways, gigantic plant vases and the like.

MILWAUKEE.—Ben. Gregory is building a new rose house. C. B. Whitnall & Co. are building a new fern house. The Wisconsin Florists' and Gardeners' Club at a special meeting June 24, passed resolu-

tions endorsing Jas. D. Reynolds of Riverside, Ill., for Commissioner of Horticulture at the World's Columbian Exposition of 1893.

ST. JOSEPH, MO.—A "rose ball" was a recent event in society circles. The staircase was covered with arches of roses; the mirrors in the ball room were curtained with roses; they hung from the ceiling and there were festoons of them from pillar to pillar; the ladies carried bunches of roses and the gentlemen wore roses in their button holes.

ST. LOUIS.—J. Juengel & Son had an unpleasant visitor in the shape of a hail storm which smashed about 3,600 square feet of glass on their greenhouses the afternoon of June 11. Covered by insurance in the Hail Association. No further serious losses are reported as no other greenhouses happened to lie in the track of the heaviest fall of hail.

NEW YORK.—Assignee Geo. W. Stephens filed the schedules in the general assignment made by William B. Scott, the florist of No. 407 Fifth avenue, June 14. The liabilities are \$5,879.33; nominal assets, \$3,658.82, and actual assets \$2,218.20. An importation of 300 Italian laurel trees consigned to R. F. Miller & Son arrived June 14, in perfect condition. The project of using the plaza of Union Square for a flower market is being vigorously agitated, a number of prominent people having interested themselves.

NEW YORK.—At Young's sale June 17, the following prices were realized: For 4-inch roses, Perle 24 cents, Meteor 16, Hoste 16, Duchess of Albany 31, Almet 25, Bride 25. For 3-inch roses: Gontier 11 cents, Hoste 9, Wootton 7, Niphetos 17, Mermet 14, Bride 13, Duchess of Albany 14, Watteville 6. The high prices for some of the above items were the result of active competition from private buyers through their gardeners, who were not limited as to prices. The prices realized on palms were quite satisfactory, except on a very few extra large specimens.

DOYLESTOWN, PA.—A heavy hail storm the evening of June 11 broke most of the glass on all the greenhouses in this vicinity. Some of the hail stones measured three inches in diameter and double as well as single thick glass was smashed. The damage to young roses and other plants was serious. The sufferers are: John T. Smith, five houses 225x18, one half of glass broken, John E. Andre, four houses 125x16, total wreck, insured; Fred Whalton, five houses, total wreck, no insurance; E. D. Darlington, six houses, about one half of glass gone, no insurance; L. Clements, two new houses 150 feet long, about one third of glass broken.

PROVIDENCE, R. I.—The display of flowers at the June exhibition was better than anticipated, eleven tables being required. The committee on roses awarded the following prizes: Best collection named varieties, N. D. Pierce, Jr., \$10; 2d, Roger Williams Park, \$5. Best 20, not less than 10 distinct varieties of any kinds, Roger Williams Park, 1st \$5; N. D. Pierce, Jr., 2d \$3. For best 6 different varieties of any kind, Silas H. Manchester, \$3; 2d, Roger Williams Park, \$2. Best 3 distinct varieties of any kind, C. C. Nichols 1st, \$2; Roger Williams Park 2d, \$1. Best specimen bloom of named new variety, John T. Frost 2d. Best display of moss roses in baskets or clusters, N. D. Pierce, Jr., \$3; Anna M. Lewi, 2d \$2. Basket of

flowers loosely arranged upon their own stems, William A. Appleton, Jr., 1st \$5; 2d, Miss A. A. Temple, \$3.

LOUISVILLE, KY.—The spring plant sales are over here and the florists say their trade was about 25 per cent larger than last year. All have done well and are cleaning out their houses and getting things in shape for another season. The school commencements have brought the usual rush of work for the florists. A decoration arranged for a wedding at Frankfort, Ky., by florist S. J. Thompson of this city, consisted of a large canopy suspended from the ceiling in the double parlors, with a curtain of smilax back of it measuring 10x10 feet. Back of all was a screen of smilax and on either side of the curtain were placed palms and other decorative plants. The edge of the supper table was festooned with smilax while through the center were low vases of roses. Through the parlors baskets of roses were placed at advantageous points. The chandeliers were also festooned with smilax.

WASHINGTON.—The meeting held in the reception room of the gardeners' headquarters at the Botanical Gardens, under the auspices of the Florists' Club, to consider the best means of providing a suitable building for a flower market, separate from the Center market, was largely attended by the florists and gardeners of this city and vicinity. A bill was prepared authorizing the Washington Market Company to erect a building on the reservation immediately north of the market between 7th and 9th streets, which would when completed be about the width of and conform to 8th street, the same to be used exclusively as a flower market. The Florists' Club has filed a certificate of incorporation. Messrs. Lonsdale and Meehan, of Philadelphia, were in the city June 20 inspecting the shrubbery of the Agricultural Grounds and other public parks, with a view it is said of noting, in the interests of nurserymen generally, the adaptability of certain foreign varieties for culture in this latitude.

Coming Exhibitions.

June 24—25, Boston.—Rose and straw berry exhibition Mass. Hort. Society.

August 19—22, Boston.—Annual exhibition Mass. Hort. Society.

October 28—Nov. 1, Atlanta, Ga.—Chrysanthemum show, Piedmont Exposition Co.

THE FLORISTS' CLUBS.

The rapid increase in the number and membership of these organizations is cause for congratulation, for the good accomplished by them can hardly be estimated. This is apparent to any one that has ever been connected with them, except to that unfortunate individual who is blind because he will not see.

The clubs have not succeeded in reconciling all past differences between members, they have not succeeded in bringing the whole trade in any city together to form one happy family, they have not brought about the millennium; but they have succeeded in softening many of the old asperities, in bringing to the surface good fellowship which had before been repressed, and in very materially strengthening the bond of union between members of the craft, which has been far too frail for the general good. Where these clubs exist there is much less of that bitter, unreasoning, cut-throat competition which had before prevailed and which does so much to lower the standard of the trade.

Form a club in your city if none already exists, but don't imagine that it is going to run itself after it is organized. There will be work to be done, and somebody has got to do it. But if all this labor should fall upon but a few, they will find that they are so well repaid by the benefits which accrue to them individually that they can well afford to make a present of their labor to other members rather than lose their own share by remaining inactive. Don't wait for some one else to start the ball to rolling—do it yourself.

THE WORLD'S COLUMBIAN EXPOSITION.

It is time that the florists, nurserymen and seedsmen of America began to consider ways and means to make their display at the Columbian Exposition of 1893 a credit to the trade and to America, for the success of the department of ornamental horticulture will certainly rest largely with them.

What shall we show the visitors and how shall it be shown? are questions which it is not too early to consider. Unquestionably a large percentage of the visitors will come from the various countries of this continent, but there will also be a considerable number from over the seas. And we must show both these classes a full and complete collection of the items which go to make up the trade in America. How shall this best be done? How shall we provide against the omission of any detail? What will you do as your share of the work? What will you exhibit?

And how shall the space allotted to the department of ornamental horticulture be arranged? Shall it be arranged by

states or according to the class of exhibits? Shall it be an aggregation of small divisions or shall it be arranged so as to form one harmonious whole? Shall the arrangement be formal or in as natural a style as possible with such a varied assortment of material?

Let us have a general discussion upon these points in the hope that ideas may be advanced which will prove valuable to those upon whom the execution of the work may devolve. Reduce your thoughts to writing and send them in.

THE HORTICULTURAL DEPARTMENT AT THE WORLD'S FAIR.

That the Department of Horticulture in the coming World's Fair be given the relative importance which it merits must be the desire of all in the trade. Those best acquainted with the results at Philadelphia in 1876, agree that no such opportunity for florists has existed in this country before or since, and that the coming Fair at Chicago is sure to be of great benefit to the entire trade. With this view it is highly desirable that ample provision be secured for this department from the commissioners, and now that they have assembled and a permanent organization with sub-committees will soon be appointed, would it not be well for those interested in our horticultural success and acquainted with these commissioners, to write them in care of the World's Fair headquarters, Chicago, urging that the Horticultural Department be made an important feature? We give the names of these commissioners in another column. Having secured, as we believe we must, ample space from the commissioners, and a liberal appropriation, it becomes important that the superintendency of that department be given to one who has the confidence of the trade, rather than to some politician who may or may not be in sympathy with the horticulturists and who certainly can not have the influence with the trade at home or abroad, and which will be so necessary to its final success, as can be expected from a man who is identified with the business.

FOR HORTICULTURAL COMMISSIONER.

Since the location of the World's Fair at Chicago, the Chicago Florists' Club has nominated Mr. James D. Reynolds for Horticultural Commissioner, believing that success in this direction depended on having a competent man on the ground from this time on. This action has been endorsed by the American Nurserymen's Association, by the American Seed Trade Association, and by various local clubs and individuals prominent in horticultural circles throughout the country. It is generally known that Mr. John Thorpe received the endorsement of the Society of American Florists last summer at Buffalo, but at the same time it was considered then a certainty that the fair would go to New York. Mr. Thorpe's interests there, would if he came to Chicago, be sacrificed, and he has, we understand, stated that he should decline the candidacy in favor of Mr. Reynolds, at the same time indicating a willingness to assist and advise whenever the time comes for active work, thus giving the department at the most important time the benefit of his wide experience in exhibitions, in the position of consulting expert. Those disposed to endorse Mr. Reynolds would do well to mention his name when writing to any of the commissioners.

World's Fair Commissioners.**COMMISSIONERS-AT-LARGE.**

Augustus E. Bullock, Boston, Mass.; Thomas W. Palmer, Detroit, Mich.; Richard C. Kerens, St. Louis, Mo.; Edward H. Ammidown, New York City; Peter H. Widener, Philadelphia, Pa.; Samuel M. Inman, Augusta, Ga.; Henry Exall, Tex.; Mark McDonald, California.

THEO. BOCK,
Cor. 10th and Heaton Sts., HAMILTON, O.

The Amateur's Lament.

Before I made my garden I was a happy man,
I read flow & Windy's catalogues and joyfully
would plan
How lots of sundries vegetables I easily could
raise,
And figured out the profits Windy says a garden
pays.

Of patent fertilizers, fancy garden tools and seeds,
I bought about as many as a western farmer
needs,
I hired men to help me and rising with the lark,
I dug till time for business and finished in the
dark.

After I made my garden I was a woful man,
The chickens scratched my pretty beds, the dogs
upon them ran;
The cats pitched battles on them fought, the
coats ate all my corn,
And a hog that tried to bite me always rooted
there at morn.

Then came a drought that burned to dust my
garden; then a flood
And pelting hail and hurricane turned every-
thing to mud;
Then like the plagues of Egypt, swarmed upon
me flies and bugs,
Inch worms, moles, cat worms, locusts, cater-
pillars, crows and slugs.

With paris green, tobacco, su'phur, soot and
hellebore
I dosed that insect army, but they only cried
for more;
I sp-iled my clothes and patience in the blazing
sun and rain,
And got myself so dirty that I always missed
the train.

All summer long I wrestled, while my perira-
tion drops,
I think, would fill the barrels I had ready for
my crops;
And though I wasn't able to supply one dinner's
needs,
I took the prize of champion for raising famous
weeds.

—*Peoria (Ill.) Call.*

NARCISSUS.

An immense collection and an enormous stock
of all the leading varieties, especially of those
adapted for forcing. Many acres are now in
flower, and I expect I shall have at least

A MILLION

of fine forcing roots to offer this season, and shall
be pleased to give prices for any variety for **EARLY
FALL** Delivery. A preliminary list has been sent
to my customers, and my General Trade Cata-
logue will be ready shortly.

CLEMATIS.

My stock for Fall delivery will be much heavier
than previous seasons. The varieties consist of
all the best kinds and may be relied upon. Also
many other varieties of Hardy and Half Hardy
Climbers.

PYRETHRUMS.

Many thousands of these are grown and form
one of the most important families of my Florist
Fellow Department. Also Carnations, Phloxes,
Delphiniums, Fancies, Pinks, Hollyhocks, etc.

HERBACEOUS PLANTS.

The increasing demand for this group, both at
home and abroad, has necessitated my adding
several acres of fresh stock, in addition to my
usual stock which is immense. Every good hardy
plant is grown in large quantities, and I shall be
pleased to quote prices for anything required.

DAHLIAS.

An extraordinarily complete collection, every
variety of every section worth cultivating will be
found described in my Retail Catalogue, published
in April. Trade list of Pot Roots published in
the Autumn.

HARDY BULBS.

Many acres grown, forming the most important
branch of my Establishment. Anemones, Lilies,
Chionodoxa, Gladioli, Begonias, Montbretias,
and hundreds of other families too numerous to
mention here.

CHRYSANTHEMUMS.

Every variety up to date, including English and
Continental, full descriptions of which will be
found in my numerous Catalogues, which may
be had on application.

THOMAS S. WARE,

409 Fifth Avenue, NEW YORK, U. S. A.

SMILAX.

My Smilax are from 2½-inch Rose and 3-inch Standard pots. They are cut back several times to
make strong, bushy plants; and are in every way a first class article that is sure to please. A sample
of the largest and smallest size that will be used to fill your order, mailed on receipt of 10 cts.

PRICE, 2½-inch, \$2.00 per 100; \$18.00 per 1000. 3-inch, \$3.00 per 100; \$25.00 per 1000.

* PANSIES. *

Will have a full supply of fall grown Seedlings, through September, October and November at
\$5.00 per 1000. 75 cents per 100, free by mail.

Quality is the principle feature in Fancies. My strain will meet all demands in this respect.
Some of my customers say they are the best in the country. Give them a trial and judge for yourself.

FRESH SEED.

We have made special arrangements with a
large grower of this charming plant, and offer fresh,
new seed at a price never before heard of. As long as
stock lasts, we will fill orders from this advertisement
at \$1.00 per thousand seeds.

John Gardiner & Co., 21 N. 13th Street,
Philadelphia, Pa.

MAMMOTH SUNBEAM PANSY.

The finest strain of Mammoth Pansies grown; very
large, of perfect form, and brilliant colors. A grand
collection of the very choicest. New Crop.
Extra, mixed, per liberal trade packet, 25 cents.
3 packets, 60 cents; 6 packets, \$1.00.

JOHN F. RUPP, Shiremansdown, Pa.

PANSY*SEED.

NEW CROP.

ORDERS BOOKED NOW, for delivery in rotation, on arrival of the new seed expected July 15th, at the following low rates:

TRIMARDEAU, choicest French mixed, unsurpassed in brilliancy of color and size of flowers, some measuring from 2 to 4 inches across. Price, per lb. \$25; oz. \$2.50; ½ oz. \$1.50; ¼ oz. \$1; ⅛ oz. 50c; pkt. 25c. **Trimardeau, Golden Yellow**, ½ oz. \$1.50; 1-15 oz. \$1; pkt. 25c. **Trimardeau, Deep Purple**, ½ oz. \$1.50; 1-15 oz. \$1; pkt. 25c.

BUGNOT'S (NEW), spotted, large flowering show Pansies, somewhat smaller than Trimardeau, but of even more exquisite markings and richer colors, pronounced by many the finest strain produced yet. This variety produces few seeds and is of very scarce. Per lb. \$40.00; oz. \$4.00; ½ oz. \$1.50; ¼ oz. \$1.00; ⅛ oz. 50c; pkt. 25c.

CASSIER'S 3 and 5 blotched tinted, extra line. Per lb. \$20.00; oz. \$2.00; ½ oz. \$1.50; pkt. 25c. **ODIER, or IMPERIALIS**, Prize Pansies, 3 and 5 blotched, extra. Per oz. \$1.00; ½ oz. \$2.50; ¼ oz. \$1.00; ⅛ oz. \$1.00; pkt. 25c.

FAUST (King of the Blacks) fine for bedding. Per oz. \$1.00; ½ oz. 75c; pkt. 25c. **EMPEROR WILLIAM**, dark blue. Per oz. \$1.00; ½ oz. 75c; pkt. 25c.

LORD BEACONSFIELD, purple. Per oz. \$1.00; ½ oz. 75c; pkt. 25c.

Bronze, fine mixed, per oz. \$1; ½ oz. 75c; pkt. 25c.

White, fine mixed, per oz. 75c; ½ oz. 50c; pkt. 25c.

Yellow, fine mixed, per oz. 75c; ½ oz. 50c; pkt. 25c.

All colors, fine German mixed, per lb. \$5.00; oz. 50c; ½ oz. 25c; pkt. 10c.

All colors, improved large-flowering, mixed, per lb. \$10.00; oz. \$1.00; ½ oz. 75c; pkt. 25c.

Terms Cash.

Extra strains to grow in Europe..... 1.50
Also strong, wintered plants *Primula Obconica*, coming into bloom, \$5.00 per 1000.

PANSIES EXTRA
THE JENNINGS STRAIN.

This seed is saved only from the finest selected plants, and I warrant it in every respect as being very fine, sure to come up. I make a specialty of Pansies, and will have none but the best. I want every florist who grows pansies to try a package of this seed. One old florist says "they are the best I have grown in 21 years." They are all of the largest size and fine color; extra fine for winter flowering. Large trade packet, 25c., 50c., and \$1 each; or by

F. R. PIERSON & CO.,

Tarrytown, New York, U. S. A.,

ORIGINAL AND LARGEST GROWERS OF

Lilium Harrisii Better known as **The Bermuda Easter Lily**
The Best in the World for Forcing for Winter Flowers.

WE OFFER ONLY STRONG FIELD-GROWN BULBS FROM OUR OWN GROUNDS IN BERMUDA.

THIS VALUABLE LILY IS OUR SPECIALTY.

We grow the bulbs by the acre on our own grounds in Bermuda. We were the first to grow it in large quantities and to offer it at reasonable prices, and we have always been recognized by the trade as

HEADQUARTERS FOR THE BERMUDA EASTER LILY.

Supplying the trade as we do both in this country and in Europe, and its highest by far the largest and the controlling stock of the genuine variety in the market.

The extent of our operations in this bulb alone will be best understood when we state that we expect to sell from OUR CROP of 1890, over a

HALF A MILLION BULBS.

Be sure you get the genuine *Lilium Harrisii*. In order to secure "the true variety," purchase your Bulbs from original stock, which is known to be pure. The value of this Lily has led unscrupulous or ignorant parties to plant *L. Longiternum* in Bermuda, or grow it there one season and send it out as *Harrisii*, and dealers should look with suspicion on bulbs offered at prices less than market rates, as the supply has never yet met the demand; "Mixed Bulbs" only being offered at reduced rates.

This is not only the best by far of all lilies for winter blooming, but it is one of the most profitable flowers that can be grown by florists. It is very easily handled, and the flowers being especially effective for decorative purposes, always command large prices. From its name some have thought it was a bulb for florists' use for forcing for the Easter market only. This is not exclusively so; it derives its name from the "Easter Lily"—but by growing it in this country in the greenhouse, with successive lots, it can be had in bloom all the winter from early in December until after Easter; in fact, by special culture, all the year round, or as long as cut flowers are in demand. The fact that it can be forced into bloom by the Christmas holidays adds particularly to its value, as it bills in at a time when flowers are usually scarce and in great demand at high prices, but to accomplish this the bulb must be potted early in August, something depending upon after treatment and temperature the bulbs are grown in.

For this purpose our Bermuda-grown bulbs are indispensable, as in Bermuda the bulb reaches its highest development, and ripens off perfectly, and is ready for shipment usually by the middle of July—before bulbs in our own country have hardly begun to make their growth. Our bulbs being grown in the open ground, in a climate naturally adapted for their perfect growth, are particularly strong and healthy at any time.

New Crop will be ready for delivery early in August. Orders booked for delivery at that date.

Large growers or dealers in this bulb should write us for special prices, stating quantity of bulbs desired, and we will give lowest estimate on the same by return mail.

F. R. PIERSON & CO.,
TARRYTOWN, NEW YORK, U. S. A.

A RARE OPPORTUNITY.

\$3,000 CASH, BUYS A BUSINESS THAT THE PAST SEASON EARNED 90% PROFIT ON PRICE ASKED.

Here is a chance for some one to buy the largest, best known and most widely advertised florist's business in the capital city of one of the western states; a city of 50,000 population, and one of the most progressive and refined communities in the west, at **A SACRIFICE FIGURE.** I is a **BUSINESS CHANCE OF A LIFETIME.** In addition to a large and very rapidly increasing local business, there is a flourishing shipping trade in both plants and cut flowers. There is not a town in the state where we are not well and favorably known—we have a list of about 1000 bona fide customers (not including local names), which will indicate the value of this department. The demand is constantly in excess of the supply, and very little opposition. The business can be indefinitely extended by push and energy. There are about 4000 feet of glass, heated by hot water, part of it ventilated by the Challenge apparatus. The place is well stocked with all that goes with a first-class business, including the reliable new and old sorts of plants, flower pots, wire designs, baskets, tools, office fixtures, show cases, horse, wagon, etc., etc. About 1,600 square feet planted in winter blooming Roses. Large stocks of Carnations, Chrysanthemums, etc., etc., coming on for winter bloom. Also good stock of Palms and decorative plants. Everything ship shape, and stock complete.

The following facts in regard to the city speak volumes: Population 1870, 3,100; 1880, 15,326; 1889, 50,000. There are over 10 miles of street paved mostly with asphalt; 30 miles of sewers; water works with 3 1/2 miles of mains; 70 miles of street railway, about half of it electric; streets are lighted by electricity. We have cheap telephone and A. D. T. messenger boy services; fine fire department and police force. There are 48 churches, 24 public schools, 3 large colleges, public buildings to the value of four and a half million dollars. There are three public libraries, large mills and factories, and in fact, all that goes to make a prosperous community. The four greatest railway systems of the west center here, making it a splendid shipping point.

Address all letters to "H. F. P." care Am. Florist.

We refer to F. R. PIERSON, Tarrytown, N. Y., or J. N. MAY, Summit, N. J.

John H. Sievers,

25 POST STREET,

SAN FRANCISCO, CAL.

The Springfield, Mass., Amateur Horticultural Society's Exhibition.

This is a young society, being less than two years old, but having a membership of over 400 and holding two exhibitions a year. It has done much to create a love for the cultivation of flowers among the people here, particularly in holding their exhibitions in the way they do, viz.: every one is invited to show what they can, but no premiums are offered, so there can be no jealousy felt. Professionals are particularly invited to send what they may wish to show.

Their second annual spring exhibition was held in Union Armory on June 17 and 18, and was largely attended. There were about 200 exhibitors and there were flowers in abundance. A noticeable feature was the large amount of native flowers shown.

The following were the professionals exhibiting: V. H. Hallock & Son, Queens, N. Y., double and single begonias, gloxinias, double pyracanthus, ten varieties of lilies and peonias; Wm. H. Spooner, Jamaica Plains, Mass., large collection of hybrid perpetual roses; Gillett & Horsford, Southwick, Mass., large collection of North American plants, among which were fine specimens of *Cypripedium spectabile*, *Kalmia latifolia* and *Adiantum pedatum*. This exhibit was especially interesting for the number of varieties which could be made of value to the trade if properly treated; J. W. Adams & Co., Springfield, Mass., fourteen varieties of strawberries, of which four are new and presented a fine appearance, being staged in the English style; Gale Floral Co., Springfield, Mass., a large basket of carnations; Charles L. Burr, Springfield, Mass., extensive collection of hardy roses, shrubs and herbaceous plants.

THE NEW FURMAN HOT WATER BOILERS

BURN PERFECTLY SOFT COAL. 56 DIFFERENT STYLES AND SIZES. Extract from OFFICIAL REPORT of the test made last winter by the Michigan Agricultural College:

"Our greenhouses are each 20x50 and 10 feet high at the ridge. They were easily kept at 50 to 60 degrees on an average DAILY consumption of 88 LBS. OF COAL during Dec., Jan. and Feb. The temperature of smoke was practically the same as water in flow pipe, and your Boilers proved in every way very efficient."

A GREAT DEAL has been said about no amount of technical or theoretical education being able to take the place of the practical experience in the greenhouse or nursery, and it is true in so far as it means that successful florists and nurserymen can not be turned out like book-keepers. But we should not therefore go to the other extreme and recommend instruction in "rule of thumb" only. What the young men need is a *symmetrical* education. The broadening and valuable elements of knowledge should supplement the daily routine of greenhouse work. The wise grower will not develop one part of the plant at the expense of another if he desires a perfect specimen, neither should he give his boys a lop-sided education, such as results from teaching all practice and no theory or all theory and no practice. A *symmetrical* education is a judicious combination of both.

Mass. Horticultural Society.

ANNUAL ROSE AND STRAWBERRY SHOW.

The rose and strawberry show which was held at Horticultural Hall, Boston, on June 24 and 25, was an unqualified success. The number and variety of roses exhibited was unusually large and the quality of the blooms averaged high.

The roses and other cut flowers and plants filled the entire upper hall all available space being occupied, and several large exhibits which could not be accommodated here had to be transferred to the lower hall, which had been reserved for the strawberry department. The arrangement of the rose displays was novel and was generally commended as a decided improvement over any former plan.

The premiums for the various classes of hybrid perpetuals as provided for in the schedule were all sharply competed for. There were six entries for the premiums for general display filling a stand of 100 bottles each, and several similar collections which were not entered for a prize, so these exhibits alone made quite a fair rose show by themselves.

The largest exhibitors were J. B. Moore & Son, Wm. H. Spooner, Warren Henstis, E. Sheppard & Son, Mrs. F. B. Hayes, J. S. Fay, J. L. Gardner, J. H. White, W. C. Strong, Mrs. E. M. Gill and C. G. Weld.

J. B. Moore & Son took the first special Theodore Lyman Prize for 24 distinct named varieties of H. P. roses 3 of each variety. Also first for 16 ditto, second for 12 ditto, and second on 6 ditto. Also third on 24 named varieties, one bloom of each, third on 6 ditto, first on moss roses, and first for general display.

Among the varieties shown by Mr. Moore were superb specimens of Earl Dufferin, Perfection de Lyon, John Bright, Heinrich Schultheis, Thos. Mills, Mme. Gabriel Luizet and Marguerite de St. Armand.

Mrs. F. B. Hayes took the special Spooner Prize for the best 12 blooms of Ulrich Brunner. Also first on 12 named varieties, one of each, and second on 18 ditto. A more perfect lot of roses than Mrs. Hayes' exhibit of 12 named varieties has seldom, if ever, been seen on these tables.

John L. Gardner took first premium for 12 varieties, three of each, first on 24 varieties, one of each, second on 12 ditto, second on 3 ditto, second on moss roses, and third on general display. Particularly well grown were Abel Carrier, Chas. Lefebvre, Duke of Edinburgh and Merveille de Lyon. The exhibit of 24 varieties in this collection was superb. The specimens of Emily Laxton and Baroness Rothschild were about as near perfect as possible.

Wm. H. Spooner received first for 18 named varieties, one of each, second on 24 ditto, third on 12 ditto, and third

special Lyman Prize for 24 varieties, three of each. Among Mr. Spooner's blooms were specially fine specimens of Earl Dufferin, Lady Helen Stewart, Gloire de Margottin, Caroline d'Ardon, Mrs. Harry Turner, Mme. Clemence Joigneaux and Baron de Bonstetten.

Mr. Spooner also showed a splendid lot of outdoor grown American Beauties and some good blooms of Mme. Montet, a clear pink rose which forces well and has been placed on the cut flower market by certain growers here under the misleading name of Charles X.

Warren Henstis took first prize for 3 named varieties, one of each, viz., Glory of Waltham, Jean Soupet and Ulrich Brunner, second on 16 varieties, three of each, and second special Lyman Prize.

J. H. White captured first for 6 varieties, three of each, second on 3 ditto, and second on 6 varieties, one of each.

C. E. Weld was first on 3 varieties, three of each, the set comprising Paul Neyron, Mme. Gabriel Luizet and Merveille de Lyon. He also took first for 6 varieties, one of each.

E. Sheppard & Sons were awarded second prize for general display.

Mr. J. S. Fay exhibited a very fine table of roses in competition for the special Lyman Prize for hybrid perpetuals which was well entitled to second place were it not for the fact that among the varieties staged was Capt. Christy, a rose which is classed by Ellwanger as a hybrid tea, and Ellwanger having been designated by the society as the authority, this display was necessarily ruled out by the committee.

Both first and second prizes for stove and greenhouse flowering plants were taken by N. T. Kidder, who staged fine plants of Anthuriums Andreanum and Ferriense and well trained specimens of Clerodendron Thompsonae and Rhynchospermum jasminoides. The prize for single specimen plant in bloom was awarded to John L. Gardner for a magnificent rhynchospermum about 9 feet high and 5 feet in diameter.

Three first premiums were awarded to John L. Gardner for orchids, viz., best 6 plants, best 3, and best single specimen. The latter was an unusually well bloomed Dendrobium Dearii, and in the former collections were neat plants of Odontoglossums crispum, cordatum and hystrix, Cattleyas Mendellii, Gaskelliana and Mossiae, and Cyrtopidiums barbatum and Lawrenceanum.

Second premium for 6 orchids was awarded to E. W. Gilmore, second for 3 and second for single specimen to N. T. Kidder, the variety staged as specimen being *Ardis nobile*.

The display of Sweet Williams was remarkably fine, E. Sheppard & Son taking first prize for an incomparable exhibit. L. W. Goodell came in second and C. E. Weld third.

In the miscellaneous department a collection of some fifty varieties of hardy flowering shrubs shown by Jackson Dawson attracted much attention. A picturesque grouping of foxgloves and peonies from J. H. Woodford filled the whole stage and formed a very effective decoration for that end of the hall. Interesting displays of wild flowers were made by Mrs. P. D. Richards and E. H. Hitchings, also ornamental foliaged trees and shrubs by W. C. Strong and J. W. Manning, the latter collection comprising upwards of 100 varieties. Mr. Manning also showed 100 varieties of flowering border plants. His method of labeling these, giving plainly the botanical name, common name and native locality is instructive and interesting and well worthy of general adoption.

R. & J. Farquhar & Co. exhibited a plant in bloom of the new annual carnation "Marguerite," a novelty of this year. The seed was sown February 15, hence only about four months have elapsed between sowing and blooming. The flower was of good form and substance, somewhat resembling carnation E. G. Hill but a trifle less brilliant.

Newton Cemetery showed a pretty collection of irises, E. Sheppard & Son a large number of named geraniums, Neal Boyle very fine double white stocks, and Mrs. F. B. Hayes a large table of late blooming rhododendrons.

Mrs. Hayes also showed a plant labeled *Bignonia precox superba*, about two feet high, bearing a profuse crop of very large and showy orange brown flowers.

T. C. Thurlow exhibited a large vase of *Kalmia latifolia* of an unusual bright rosy red, a most striking variety.

The strawberry department of the exhibition, while a little outside of the AMERICAN FLORIST's legitimate sphere, deserves a passing notice here. There were many new varieties and seedling strawberries shown; Mr. A. B. Howard leading the list with a collection of fifty-five seedlings. A silver medal was awarded to B. M. Smith's "Beverly." This variety resembles its parent "Miner's Prolific," but is a larger berry. Among the new berries receiving special prizes and favorable notice may be mentioned Louise, Crawford, Henderson, Bay State, Burgess' Seedling and several unnamed seedlings.

The whole exhibition was a pronounced success, a fact due in no small degree to the able efforts and popularity of Mr. P. Norton, chairman of the committee of arrangements. An invitation was extended to the members of the National Editorial Association which was holding its annual convention at Boston, to visit the show. The invitation was very generally accepted, and many of the delegates from the far west and south will no doubt carry home with them decided convictions respecting Boston's pre-eminence in the rose and strawberry line.

WM. J. STEWART.

Specimen Chinese Wistaria.

The engraving is from a photograph of a Chinese wistaria trained upon the north-east side of the residence of Col. Henry W. Wilson, 190 Dorchester street, Boston, Mass. It was planted in 1863, and now covers a space of 20x25 feet. The main stem is sixteen inches in circumference at one foot above the ground.

The engraving can give only a faint idea of the beauty of the plant when covered with drooping racemes of purple bloom.

The Spring Plant Trade.

ELGIN, ILL.—About same as previous years and no change in prices, 4-inch geraniums retailed at 15 cents each.

UTICA, N. Y.—Sales and prices about as usual, 4-inch geraniums retailing at \$12 to \$15 a hundred. Collections and quality of plants about as usual.

NORWICH, CONN.—Sales and prices same as last year; 4-inch geraniums retailed at \$1.50 a dozen. Quality was below the standard owing to cold nights and rain.

OMAHA, NEB.—Somewhat larger, but prices cheaper this year, 4-inch geraniums retailed at \$2 a dozen. Quality better than last year. Collections are rather slow.

SYRACUSE, N. Y.—Total sales larger than last year. Prices about as usual, 4-inch geraniums retailing at \$1.50 a dozen. Quality of plants fully up to the average.

DENVER, COL.—About 15 per cent larger. No change in prices, 4-inch geraniums retailing at \$2 to \$2.50 a dozen. Quality above the average. Collections about as usual.

LA CROSSE, WIS.—A decided increase, and prices fully as high as usual; 4-inch geraniums retailed at \$1.20 a dozen. Quality equal to last year and collections about as usual.

SALT LAKE CITY, UTAH.—About 20 per cent increase. No change in prices, 4-inch geraniums retailing at \$2 a dozen. Quality of plants was above the average. No difference in collections.

FOND DU LAC, WIS.—Larger with increase for roses, pansies and colons. No change in prices, 4-inch geraniums retailing for \$1.50 a dozen. Collections better and more cash customers.

MUSCATINE, IOWA.—A slight increase over last year, mainly in call for roses. Prices same as usual, 4-inch geraniums retailing at \$1 a dozen, quality about as usual. Collections are good.

KANSAS CITY, MO.—About 20 per cent increase with prices and quality of plants about as usual. There was a larger call for hardy plants than ever before. Collections are a little slower than usual.

WILMINGTON, DEL.—Somewhat smaller than usual, more call for alternantheras. Prices about as usual, 4-inch geraniums retailing at \$1 a dozen. Quality up to standard. Collections good as usual.

LAWRENCE, KAN.—About 10 per cent smaller than last year. Prices about as usual, 4-inch geraniums retailing at \$2 a dozen, quality of plants good as any previous year. Collections about as usual.

SCRANTON, PA.—About 10 per cent larger. Increased call for sub-tropical plants. No change in prices, 4-inch geraniums retailed at \$1 a dozen, quality of plants better. Collections slower than last year.

DANVILLE, ILL.—About same as last year, no increase. Prices slightly lower, 4-inch geraniums retailed for 15 cents each and \$1.50 a dozen. Quality of stock better than usual. Collections are slower than last year.

SEATTLE, WASH.—Being first spring can't make comparisons. Trade was good and prices fair. Roses sold well. Good 4-inch geraniums retailed at \$4 a dozen. Collections slow. All good stock sells at fair prices here.

MALDEN, MASS.—Volume of trade, prices, and quality of plants about as usual. Collections are satisfactory. Retail trade is injured here by peddlers who buy plants at auction and sell to our customers at low prices.

TORONTO, ONT.—About as usual, possibly a trifling increase. No change in prices from former years, 4-inch geraniums retailed at from 75 cents to \$1.25 a dozen, \$1 being about the average. Collections average as good as usual.

SAGINAW, MICH.—About 20 per cent larger than last year. Prices about as usual, 4-inch geraniums selling at \$1.25 a dozen, quality of plants was above the average. Collections are satisfactory. Increased call for hardy stuff.

READING, PA.—About same as usual. Noted a better demand for palms. Prices about as usual, 4-inch geraniums retailing at \$1 to \$1.50 a dozen. Quality of plants was 25 per cent better than usual. Collections are about as usual.

WASHINGTON, D. C.—About as large as usual, supply of two-year old roses not equal to demand. Prices up to standard; 4-inch geraniums retailed at \$1 a dozen. Quality rather below the average. No complaint regarding collections.

DALLAS, TEXAS.—Much larger than last year; prices about as usual, 4-inch geraniums retailing at \$1.50 to \$2 a dozen, quality about as usual. Collections are very good. Increased demand for good plants in bloom at holiday times.

NASHVILLE, TENN.—Sales somewhat larger and prices about as usual, common 4-inch bedding geraniums retailing at \$1.50, good ones at \$2 a dozen. Owing to mild winter quality below the standard. Collections about as usual.

EVERETT, MASS.—No change from last year in amount of sales or prices, 4-inch geraniums wholesaled at \$8 a hundred, 3½-inch at \$7. Quality of plants was good but season was late. Collections are very satisfactory—better than ever.

DAVENPORT, IOWA.—About 10 per cent increase over last year, the increase being mainly for hardy plants. Prices about as usual, 4-inch geraniums retailing at 25 cents each, quality of plants better than usual. Collections are very prompt.

LANCASTER, PA.—About 25 per cent increase with better demand for colons and geraniums. Prices same as previous years, 4-inch geraniums retailing at \$1.50 a dozen. Quality of plants was better than the average. Collections are prompt.

PORTLAND, ME.—About 15 per cent increase. Prices same as last year, 4-inch geraniums retailing at \$1.25 to \$1.50 a dozen. Pansies and verbenas were extra in quality, other plants about as usual. Collections show no change from last year.

NEWPORT, R. I.—A small increase. Prices about as usual, 4-inch geraniums retailing at \$1 a dozen. Quality of plants above the average. Collections about as usual. It don't pay to raise geraniums in 4-inch pots to sell at 75 cents to \$1 a dozen.

BIRMINGHAM, ALA.—About 10 per cent increase with better demand for palms and Rex begonias. Prices were about as usual, 4-inch geraniums retailing at 15 cents each. Quality of plants was quite as good as usual. Collections are satisfactory.

INDIANAPOLIS, IND.—Average a slight increase. Prices averaged somewhat

SPECIMEN CHINESE WISTARIA

lower than last year, 4-inch geraniums retailed at \$1 to \$1.50 a dozen, \$1.25 being about the average. Quality not quite up to former years. Collections rather slow.

SALEM, MASS.—Spring trade showed the usual increase the extra call being mainly for bedding plants. Prices ruled same as usual, 4-inch geraniums retailing at \$1 to \$1.50 a dozen, quality of plants above the average. Collections much better than last year.

NEW BEDFORD, MASS.—Somewhat larger than last year with increased call for geraniums and hardy stuff. Prices about as usual, 4-inch geraniums retailing at \$1 to \$1.50 a dozen, a few bringing as high as \$2. Quality was a good average. Collections are satisfactory.

ST. JOSEPH, MO.—About 20 per cent larger with increase for pansies and decrease for carpet bedding plants. Prices same as usual, 4-inch geraniums retailing at \$1.50 a dozen. Collections good as usual. A marked increase in call for geraniums and large roses.

GRAND RAPIDS, MICH.—Larger, the main increase being in geraniums. Prices about as usual, 4-inch geraniums retailing at \$1 a dozen. Quality a little better. Collections about as usual. People are inclined to buy hardy stuff such as roses, clematis and hardy shrubs.

OSWEGO, N. Y.—About 10 per cent larger with increased call for geraniums

and pansies. Prices ruled somewhat lower than previous years, 4-inch geraniums retailed at \$1.50 a dozen, quality of plants rather better than usual. Collections are about as usual.

HOLYOKE, MASS.—Spring trade showed the usual steady growth with more demand for geraniums and hardy plants. Prices rather better on the whole, good 4-inch geraniums retailed at \$1.50 a dozen. Quality of stock was extra good. Collections are about as usual.

RICHMOND, VA.—About one-third larger than last year, the main increase being in call for geraniums, verbenas and roses. Prices somewhat lower than heretofore, 4-inch geraniums retailed at \$1 a dozen. Quality of plants above the average. Collections as prompt as usual.

ST. LOUIS.—Larger than last year with increased call for hydrangeas and alternantheras, less call for coleus. Prices fully equal to previous years and in some cases better, 4-inch geraniums retailed at \$1 to \$1.50 a dozen. Quality was excellent. Collections are better than usual.

POUGHKEEPSIE, N. Y.—Larger than usual by 25 per cent; good pansies sold well. Prices about as usual, 4-inch geraniums retailing at \$1 a dozen, quality of plants was good. Popular prices, at which all can buy, are the coming prices. Collections are prompter than last year.

SPRINGFIELD, ILL.—About 20 per cent increase, hydrangeas selling better than

usual. Prices were about as usual, 4-inch geraniums selling at \$1 to \$1.50 a dozen, quality of plants rather better than usual. The florists here seem to feel well satisfied with the spring trade. Collections are as prompt as usual.

OTTAWA, ONT.—About same as usual, possibly an increase in call for geraniums. No change in prices, 4-inch geraniums sold at \$1 to \$1.50 a dozen, quality under the average owing to cold spring. The increase in the number of small growers who sell for what is offered has spoiled plant business here.

CINCINNATI.—Small increase. Noted a larger call for alternanthera and echeverias. Prices averaged the same as formerly, 4-inch geraniums retailing at \$1.25 to \$1.50 a dozen. Quality below the average. Collections better than usual. The demand for bedding roses and coleus was rather poor.

HARTFORD, CONN.—About same as last year, one florist reporting an increased call for coleus and vase plants. Prices averaged about same as last year, possibly a little higher in some cases, 4-inch geraniums sold at \$1 to \$1.50 a dozen, quality of plants rather better than usual. No trouble in collecting bills.

MT. VERNON, N. V.—About 10 per cent larger with increased call for herbaceous plants. Prices were about as usual, 4-inch geraniums sold for \$1 a dozen. Quality of stock was very good. Collec-

tions are fair—about as usual. An increased demand was noted for cannas and other large, showy plants.

ANNISTON, ALA.—Trade too young here to make comparisons. Foliage plants seem to be liked here. Plants were of good quality, 4-inch geraniums sold for 75 cents to \$1 a dozen. The variable season, late frost in March and suddenly hot weather made people a little shy of buying. Collections are slow.

VONKERS, N. Y.—About the average, possibly a slight increase, better demand for geraniums. No increase in prices, 4-inch geraniums retailed at \$1 to \$1.50 a dozen. Quality of plants equal to previous seasons. Collections slightly better than last year. Sales of trees and shrubbery better than past three years.

HARRISBURG, PA.—About one-fourth larger with more call for alternantheras and coleus and less for fuchsias. Prices rather better than usual, 4-inch geraniums retailed at \$1.25 to \$1.50 a dozen. Quality of plants up to the average. Collections better than usual. All stock was sold out pretty close by all florists here.

ERIE, PA.—About same as last year, possibly a slight increase. Better demand was noted for fuchsias and heliotropes. Prices nearly the same as usual, a trifle higher if anything, 4-inch geraniums retailed at 15 cents each or \$1.50 a dozen. Quality of plants better than usual. Collections about same as last year.

JACKSON, MICH.—Much larger than last year, but prices were low, 4-inch geraniums retailed at \$1 a dozen or \$8 a hundred, other bedding plants in 4-inch pots at same price, quality of plants was excellent. Detroit florists seem to be selling plants as cheap at retail as at wholesale, and we have to meet their prices.

LOUISVILLE, KY.—About 10 per cent larger than last year. One florist noted an increased call for coleus. Prices ruled about the same as previous years, 4-inch geraniums retailed at \$1 a dozen. Quality of plants about as usual, collections same. Roses were scarce, especially 2-year old plants for which there was a brisk demand.

WINCHESTER, MASS.—About one-eighth decrease from last year. Prices about as usual, 4-inch geraniums retailed at from 85 cents to \$1.25 a dozen. Quality of plants was a fair average. Collections satisfactory. The season was the most unfavorable for the last 20 years, being either cold or wet during most of the selling season.

FALL RIVER, MASS.—A trifle larger with an increased call for hardy and half-hardy plants. Prices were lower, first-class 4-inch geraniums retailed at \$1 to \$1.25 a dozen. Quality of plants was good on the average. Collections are better than last year. Vincas were very scarce, there was increased call for filled vases and window boxes.

SPRINGFIELD, MASS.—Somewhat larger with increased call for palms and decrease for coleus and similar foliage plants. Prices were about as usual, 4-inch geraniums retailed at \$1 a dozen. Quality of plants rather above the average and collections about as usual. Competition was sharp, altogether too sharp for the general good.

HELENA, MONT.—Spring plant sales were double those of last year, a notable increase in demand for pansies and ver-

benas. Prices were about the same as last year, 4-inch geraniums retailed at 35 cents each, quality of stock equal to previous years. Owing to cold season outdoor stuff is poor up to date. Collections have been very prompt.

MEMPHIS, TENN.—About 15 per cent larger than last year with prices about as usual, rather better than otherwise, 4-inch geraniums retailed at \$1.50 to \$2 a dozen, some extra good ones bringing as high as \$2.50. Quality of plants was good, possibly a trifle over the average. Collections have been very satisfactory, rather better than usual.

NORTH CAMBRIDGE, MASS.—Total sales about same as usual, prices somewhat lower especially on geraniums and pansies, 4-inch geraniums retailed at 75 cents to \$1 a dozen, quality of plants up to the average. Collections as good as usual. Decline in prices was caused by competition of plants bought at from one to five cents each at the auctions.

NASHUA, N. H.—Somewhat larger than last year with increased call for plants of first quality, less call for coleus, hydrangeas sold well. Prices averaged about equal to last year, quality of plants about as usual, 4-inch geraniums retailed at \$1 to \$1.50 a dozen. One florist reports collections about as usual and another says they are slower.

PITTSBURGH.—At least 10 per cent larger than last year. Prices ruled much the same as last year, 4-inch geraniums retailed at from 75 cents to \$1.25 a dozen, the average being about \$1. Quality of plants was about the average taken generally. Collections are decidedly better. Season was backward, but held up better after Decoration Day than ever before.

TERRE HAUTE, IND.—Much larger than last year with increased call for alternantheras, geraniums and verbenas. Prices about as usual, 4-inch geraniums retailed for \$1.50 a dozen, extra select plants bringing \$2, quality of plants was never better. Collections are prompt as usual with us. Demand for specimen palms and other decorative plants is on the increase.

MONTREAL.—Average about same as previous years. Increased call for carpet bedding plants, decrease for petunias, verbenas and annuals. Prices same as last year, 4-inch geraniums retailed at \$1.50 a dozen. Quality of plants was up to the average except alternantheras. Collections about as usual. Season was about two weeks late owing to wet, cold weather.

EVANSVILLE, IND.—About the same as last year, possibly a trifle less, one florist noting an increased call for roses. Prices a trifle lower than usual, 4-inch geraniums retailed at from \$1 to \$1.50 a dozen, but sold slow. Quality of plants equal to previous years, collections about as usual. A late and wet spring delayed sales fully three weeks making the selling season short.

NEW HAVEN, CONN.—Total volume of trade about as usual, increased call for vase plants. Prices same as usual, 4-inch geraniums retailed at \$1.50 a dozen. Quality equal to previous years and collections about as usual. Several wealthy citizens who keep gardeners have turned their gardens into sales places and the increased competition makes it difficult to keep prices up to a paying basis.

DES MOINES, IOWA.—Fully 25 per cent larger than last year, large call for pansies and plants for foliage beds, and a decidedly

increased demand for scarlet geraniums for beds of one color. Prices averaged about as usual, 4-inch geraniums bringing \$1.50 to \$2 a dozen, quality of plants better than usual. Collections are better than ever before. There was an excellent demand for hardy roses and clematis.

PROVIDENCE, R. I.—One florist reports the spring plant trade as about equal to previous years and another as one-third less than the average. One notes an increased call for roses and hydrangeas. Prices were about as usual, 4-inch geraniums retailed at from 50 cents to \$1.50 a dozen, quality of plants compared favorably with previous years. Collections rather more prompt than usual.

JERSEY CITY, N. J.—About same as previous years, possible a small increase. Prices ruled about as usual, 4-inch geraniums retailed at 15 cents each and \$1.50 a dozen up to Decoration day and 10 cents each or \$1 a dozen after that time. Quality of plants was rather better than usual. One florist who sold out cleaner than usual accounts for it by not having so much stuff in small pots—propagated late.

RACINE, WIS.—A trifle larger than last year with a slightly increased call for foliage plants. Prices about as usual, quality of plants good, 4-inch geraniums retailed at \$1.50 a dozen, collections good. Most all bedding stuff from 4-inch pots sold at \$1.50 a dozen, 3-inch at \$1, except coleus in quantity which sold for somewhat less, pansies were good sale at 50 cents and verbenas at 75 cents a dozen.

HAMILTON, ONT.—Will average a small increase but there is a decided tendency toward lower prices owing to the many new growers who have largely increased production. Choice 4-inch geraniums retailed at \$1 a dozen, but 75 cents was about the standard and great numbers were sold for what the seller could get. The established growers kept up the quality of their stock to the usual average.

DAYTON, O.—At least one third larger than last year with increased call for geraniums and coleus. Prices ruled fully as high as usual; 4-inch geraniums retailed at from \$1 to \$1.50 a dozen. Quality of plants better than previous years. Collections good. A great increase in cut flower trade, got good prices till late in season. One florist who makes a specialty of the clematis reports largely increased sales of that plant.

BUFFALO, N. Y.—About 15 per cent increase with better call for cannas, caladiums and fine foliage plants. Prices were quite as good as usual, 4-inch geraniums retailed at \$1.50 to \$1.75 a dozen. Quality of plants was fully up to the standard, in some cases superior. Collections are very satisfactory. Our prices for bedding plants compare favorably with other cities, but buyers here demand first quality stock at these prices.

ELMHURST, N. Y.—About 25 per cent larger than last year with greatly increased demand for alternantheras. Prices about as usual, 4-inch geraniums retailed at from \$1 to \$1.50 a dozen, quality of stock better than usual. This season was more favorable for sales. At the time of selling last year this section was visited by a disastrous flood, and the lessened trade last year accounts in a measure for the comparative increase this year.

MILWAUKEE, WIS.—From 10 to 25 per cent larger than last year with in-

creased call for carpet beds. Prices were about as usual, good 4-inch geraniums retailed at from \$1 to \$1.50 a dozen—poor ones were given away. Quality of plants averaged better than in previous years, collections about as usual. Bedding looks better than last year at this date. Customers discriminate more intelligently as to quality of plants and will more readily pay a fair price for first class stock.

LOWELL, MASS.—About the average, possibly a slight increase. One florist notes an increased call for fuchsias and double petunias, another for potted hardy roses in pots. Prices generally ruled about same as usual, 4-inch geraniums retailing at \$1 to \$1.50 a dozen, the majority being sold at the lower price. Quality of plants was rather better than usual. Collections are rather slower. Several farmers who have started greenhouses and sell very cheap have lowered prices in this vicinity.

DORCHESTER, MASS.—About 20 per cent larger than last year. Noted an increased call for hydrangeas and quite a marked decrease in that for geraniums and Golden Bicolor coleus. Prices averaged one-third less than in previous years; the average retail price for 4-inch geraniums was \$1 a dozen. Quality of plants was excellent. Collections very satisfactory. On account of two wet summers geraniums and Golden Bicolor coleus showed a falling off in sales, but with a dry summer think sales of both would improve.

PHILADELPHIA.—About 15 per cent decrease, though there was an increased call for palms and large roses. Prices ruled about as usual, slightly lower on palms and similar plants, 4-inch geraniums retailed at \$8 to \$12 a hundred according to quality. Quality of stock was about as usual, except roses which were smaller owing to wet season of 1889. Collections are rather better than usual. One large grower noted an increased demand for hardy, herbaceous plants and less call for coleus, alternantheras, etc.

NEW ORLEANS.—One florist reports an increase of 20 per cent and another a decrease of 50 per cent, both an increased call for palms and similar plants, one much less call for all bedding plants on account of mild winter. One reports prices better and the other as 10 per cent less on bedding plants. One sold 4-inch geraniums at \$1.50 to \$1.75 a dozen and the other at \$1.50 to \$3 a dozen. Quality of greenhouse plants was equal to last year. One says that bills are paid promptly and the other says collections are very slow.

ROCHESTER, N. Y.—Sales were slow at first, but last few weeks brought the total sales up so they will average equal to last year and possibly a slight increase. While many florists report poor sales, still if you go into their houses you find they have nothing left. There was more fancy bedding in alternantheras, echeverias, etc., and an increased call for palms and hydrangeas was noted by some. Prices kept up very well for first class plants, 4-inch geraniums bringing \$1.25 to \$1.50 a dozen. Quality was good in most places, but there was a lot of cheap stuff sold which was very poor. Outdoor roses have been very fine about Rochester this season. Collections are as prompt as usual.

BALTIMORE.—About same as last year, possibly a very slight increase. Two florists noted an increased call for large

roses, and one for hydrangeas. Prices no higher than in previous years and in some cases lower on account of sharp competition here. Principal florists held 4-inch geraniums at \$1 a dozen, and some extra good ones brought 15 cents each, but on the market they were sold for as low as 4 and 5 cents each. Quality of plants compared favorably with that of previous years, but market people complained of slow sales, as owing to dull weather plants were not in as brilliant bloom as is necessary to sell well in the market, and backward season hurt sales. Collections average about as usual. One florist reports an increased demand for herbaceous stuff and says that buyers are discriminating with better judgment between well and poorly grown plants.

PATERSON, N. J.—Spring plant trade probably averaged about the same as last year, though one florist reports a decrease of 50 per cent in his sales. There was some increase in the call for good geraniums, also for coleus and alternantheras. Prices averaged about the same as in previous years, 4-inch geraniums selling at 10 cents each or \$1 a dozen, \$10 a hundred planted out, though some sales were made as low as 5 cents each. Quality about the average. Collections are much more promptly made than last year. The season was at least two weeks behind that of former years which probably had the effect of shortening sales in some cases. One florist says "The plant trade in this section is run down by farmers and others going into it, also by peddlers and hucksters who buy plants at auction and bring them here."

Programme for the Boston Convention.

TUESDAY, AUG. 19, 1890.

FIRST DAY—Opening Session, 10 o'clock A. M.

ADDRESS OF WELCOME, BY THE GOV. OF MASS., AND THE MAYOR OF BOSTON—RESPONSE, ROBT. CRAIG, PHILA.—PRESIDENT JORDAN'S ADDRESS—REPORTS OF SECRETARY AND TREASURER—REPORTS OF STANDING COMMITTEES—MISCELLANEOUS BUSINESS—DISCUSSION OF PRESIDENT'S ADDRESS.

FIRST DAY—Evening Session, 7 o'clock.

ESSAY—The growing importance of Easter trade, and how to prepare for it. JAS. DEAN, Bay Ridge, N. Y.

Discussion.

ESSAY—The Value of System in Business. D. B. LONG, Buffalo, N. Y.

Discussion.

QUESTION BOX.

WEDNESDAY, AUG. 20, 1890.

SECOND DAY—Morning Session, 9:30 o'clock.

Selection of place of meeting for 1891.

Nomination of officers for ensuing year.

ESSAY—Hybridization. E. S. CARMAN, River Edge, N. J.

Discussion.

Election of State Vice-Presidents by State Delegations.

SECOND DAY—Evening Session, 7:30 o'clock.

ESSAY—Best Twenty-five Hardy Herbaceous Plants for Florists Use. J. WOODWARD MANNING, Reading, Mass.

Discussion.

ESSAY—Succulents. E. S. MILLER, Floral Park, N. Y.

Discussion.

Discussion on Landscape Gardening.

This subject proved to be most interesting at the Buffalo meeting, and an opportunity will be given to all who wish to express their opinions on the subject at this time.

QUESTION BOX. (see below.)

The Florists' Hail Association will meet at Horticultural Hall one hour previous to the opening of the Evening Session, Second Day.

THURSDAY, AUG. 21, 1890.

THIRD DAY—Morning Session, 9:30 o'clock.

Election of officers.

ESSAY—The use of Special Fertilizers Under Glass. PROF. S. T. MAYNARD, of Mass. Agri. College, Amherst, Mass.

Discussion.

Review of plants of recent introduction.

THIRD DAY—Evening Session, 7:30 o'clock.

Final committee reports.

Miscellaneous business.

QUESTION BOX. (see below.)

FRIDAY, AUG. 22, 1890.

FOURTH DAY.

The fourth day will be devoted to social enjoyment. The Gardeners' and Florists' Club of Boston will tender to the members of the Society of American Florists a trip in Boston harbor and along the Massachusetts coast, to be followed by a banquet at Nantasket Beach. Other hospitalities which have been prepared for the pleasure of the delegates, including a number of invitations to notable private establishments, will be announced at the proper time.

QUESTION BOX.

The following subjects for the Question Box have been already sent in, and together with those placed in the Question Box during the session, will be assigned to gentlemen competent to reply to them. Five minutes will be allowed for each reply, and they will be replied to at the three evening sessions, and will be grouped as nearly as possible so that subjects of general interest to the trade will be assigned to the first evening; cultural questions to the second evening; and questions relating to mechanical appliances, etc., to the third evening.

SUBJECTS.

1. Berry-bearing Plants for Fall Use?
2. Twenty-five Plants Indispensable to the Extreme South?
3. Acclimation of Southern Plants in the North?
4. Twelve Best House Plants for Window Gardening?
5. How must Liliun Auratum be Handled to make it a Permanent Success in Open-air Culture?
6. Can the Hellebores be Grown to Advantage by the Commercial Florist?
7. Can we Reasonably Expect a Race of Early Chrysanthemums, blooming in September and October, Valuable for America?
8. Best Method of Treating Callas during Summer to have them in bloom for the holidays?
9. Best Method of Forcing Early Hybrids?
10. Twelve Best Hardy Shrubs for Florists' Use?
11. Twenty Best Native Plants suitable for Florists' Use?
12. The Use of Foliage in Connection with Cut Flower Work?
13. How to Increase Public Interest in the Society and its Objects?
14. Is the Selling of Flowers, etc. through Commission Men the best possible Plan of Marketing our Produce? (To be answered by a grower, a commission dealer and a retailer respectively.)
15. What can be used to make a Vapor that will Destroy Red Spiders and not injure Vegetation in Greenhouses?

16. Petroleum: Is it Profitable in Greenhouse Heating?

17. What can be said in favor of Overhead Heating?

18. Is Double thick Glass the best and in the long run the Cheapest?

Nomenclature.

S. A. F. Committee on Nomenclature.

JAMES D. RAYNOLDS, Riverside, Ill., Chairman.

Roses:

ROBERT CRAIG, 49th & Market Sts., Phila., Pa.
EDWIN LONSDALE, Chestnut Hill, Phila., Pa.
ERNEST ASSMUS, West Hoboken, N. J.

Carnations

A. E. WHITTE, Albany, N. Y.
JOHN THORPE, Pearl River, N. Y.
WM. FALCONER, Glen Cove, N. Y.

Palms, Ferns, and like Decorative Plants:

CHAS. D. BALL, Holmesburgh, Phila., Pa.
JOHN BURTON, Chestnut Hill, Phila., Pa.
W. R. SMITH, Botanic Garden, Washington, D. C.

Chrysanthemums:

JOHN THORPE, Pearl River, N. Y.
WM. FALCONER, Glen Cove, N. Y.
J. M. KELLER, Bay Ridge, N. Y.

Bedding Plants:

G. L. GRANT, 54 La Salle St., Chicago, Ill.
ROBERT CRAIG, 49th & Market Sts., Phila., Pa.
J. M. KELLER, Bay Ridge, N. Y.
A. E. WHITTE, Albany, N. Y.

Orchids:

DAVID ALLAN, Mt. Auburn, Mass.
BENJ. GREY, Malden, Mass.
WM. FALCONER, Glen Cove, N. Y.
J. FORSTERMAN, Newtown, N. Y.

A Last Call.

Every one has agreed for a long time that our nomenclature needed revising and every one seemed to think as soon as a committee of able men was appointed for this purpose the work was as good as done. Then after a little while when they found that the work was not done people were much surprised and began to wag their heads and even to take pen in hand and write to the *FLORIST* intimating that the committee was no good.

It does not seem to have occurred to these cavilers that there was any divided responsibility in the matter and that in fact they themselves were as much to blame as any one for this tardiness of action. It is high time the fact was realized that this work is one that no committee can perform without co-operation. No man, nor any fourteen men can draw from their own experience the necessary data. It is needful to utilize the experience of all the members of the society. There can be hardly one reader of the *FLORIST* who has not in his mind one or more (and generally a good many more) cases of misnaming. If every one would write these down and send them in, stating in each case what in their opinion was the true name, it would be of immense assistance. Then the committee would have ample material to work on.

In the considerable number of cases where the identity of a plant is not doubtful, but it is uncertain which of two or more names rightfully belongs to it, the question could be settled off-hand by mere preponderance of opinion. But in the much larger class where there is room for doubt whether plants sent out under different names are or are not identical, it will become necessary to make arrangements for testing, and this fortunately has now become a practicable thing owing to the promise of assistance from the Agricultural Experiment Stations. With this co-operation from the members at large on one hand and the Experiment Stations on the other it is certain that valuable work may be done, but co-operation we must have.

Again and again has the *FLORIST* urged all who know of any case of misnaming to communicate it to the nomenclature

committee, but the appeal has fallen on deaf ears. There has been a stolid apathy and indifference all around that might almost seem to justify the committee in resigning their task on the assumption that people do not really care whether their nomenclature is corrected or not. If you do care are you not willing to show it by helping along a little. Give the committee some assistance and they will show some adequate results, without this assistance you cannot expect results. You have no more right to expect it than had old Pharaoh to ask the Israelites to make brick without straw.

An addressed postal card has been sent to every member of the S. A. F. with the request that known cases of misnaming be set down thereon and mailed to the chairman of the committee. Please set down *every case* you know of, never mind whether the ones you have in mind are so notorious that you are sure every one else will mention them and so think there is no need for your doing it. That sort of argument would prevent our getting any replies at all, and has prevented it so far. It does not matter how many mention the same case, the more the better, only do not pigeon-hole the postal card, fill it out and return by next mail and have it off your mind.

The nomenclature committee meets in Boston August 18, and there is no time to lose.

J. D. R.

Cactus Dahlias.

From *Dahlia Juarezii*, a vivid scarlet flowered kind from Mexico, has sprung the many beautiful varieties now known as cactus dahlias. The name cactus dahlia was given to *D. Juarezii* as soon as its flowers were first exhibited in England because of their broad uneven petals and brilliant cactus-like coloring.

Dahlia Juarezii was first introduced to the old World by Mr. J. T. Van der Berg, of Juxphaar, Utrecht, who in 1872 received a small tuber of it from a friend in Mexico. In 1873 young plants raised from this tuber were planted out in summer, and astonished everyone who saw them by their peculiar flowers so different in shape from those of any other dahlia in cultivation, and of such a glowing scarlet hue. After passing through one or two other hands it was introduced into England from Holland by Mr. W. H. Cullingford, of Phillimore Gardens, London, and who is well known to most of us through his connection with chrysanthemums. From Mr. Cullingford Mr. H. Cannell of Swanley, got it, then of course the world had it.

It was first exhibited in England at the meeting of the Royal Hort. Society, London, September 16, 1879, by Cannell, when it was awarded only a botanical certificate! Since then, however, the tide of public opinion has turned in its favor from probation to adoration, and florists and hybridists have handled it vigorously till now we have dozens of new varieties of this type, with white, yellow, purple, crimson and scarlet flowers, but none surpassing in brilliance the original *Juarezii*. And the fathers of the great R. H. S. have turned into the stream of love and now every year shower their choicest blessing—a first-class certificate—upon the children of President *Juarezii* dahlia.

As a selection of varieties of cactus dahlias I don't think I can do better than name those in the collection of 12 varieties of decorative and cactus dahlias that won the first prize at the exhibition of the National Dahlia Society, held in the Crystal Palace, London, September 6 and 7, last year. They were: Asia,

Amphion, Empress of India, Henry Patrick, Honoria, Juarezii, Lady Marsham, Mrs. Hawkins, Panathea, Professor Baldwin, Prince of Wales and William Darville. The first prize collection of six varieties contained Amphion, Beauty of Brentwood, Centenary Year, Empress of India, Marchioness of Bute and Panathea.

A nice selection of cactus dahlias would be Amphion, chrome yellow, flushed; Beauty of Brentwood, purple; Charming Bride, white tipped with pink; Empress of India, deep crimson; Henry Patrick, white; Panathea, rich reddish salmon; Prof. Baldwin, bright orange; Sydney Hollings, dark maroon; William Pearce, yellow; Zulu, blackish crimson, and the indispensable Juarezii.

But the cactus dahlias are not all retained in their purity; into them is being infused the blood of show and fancy varieties, and these have given rise to the "decorative" dahlias or intermediate forms, several of which also are strikingly beautiful. Cactus dahlias are of vigorous habit and copious nature, and as good for outdoor decoration as are the formal show and fancy sorts, and far more desirable for cut flowers, that is, being more elegant and less formal they are more pleasing to the eye.

W. F.

Arboretum Notes.

x.

There are now about 2,300 species and varieties in the trial grounds of the Arnold Arboretum. Seeds and plants are being constantly received from all parts of the world, and under Mr. Dawson's skillful manipulation their good points, if they have any, are speedily brought out.

The first and most important requisite is hardiness. Nothing is wanted here unless it will withstand an average New England winter, and any candidate be it ever so beautiful, which fails in this respect is soon discarded.

No new shrub has been introduced here for many years that is such an acquisition as *Rhododendron Vaseyi*. A plant of this in bloom in early spring is a most charming sight. The pure pink blossoms appear before the leaves and are so abundant as to literally cover the plant. It is perfectly hardy. In its original form it is destined to stand in the first rank as a garden shrub, and the possibilities in the way of cross breeding with other valuable species can not be overestimated.

The earliest rose to bloom this year was *Rosa acicularis cinamomum* var. *Siberica*. This was in flower May 22.

A very shapely little shrub is the *Prunus padus* fl. pl., a semi-double form of the common European Bird Cherry. The flower spikes are six inches long, pure white and very fragrant. Small sized plants flower profusely.

Viburnum opulus nanus has quite an unusual appearance. It grows low and close, perfectly flat across the top as if clipped, and makes a valuable dwarf hedge plant. It seldom blooms.

Among andromedas one of the earliest and prettiest is *A. polifolia*. It is evergreen and the delicate little pink flowers are borne in clusters at the tips of the shoots.

Among the very best hardy shrubs for early cut flowers are the perennial candy-tuffs *Iberis tenoreana* and *corredoia*. The latter blooms about ten days later than *tenoreana*. For Decoration Day work in this latitude nothing better for a serviceable pure white flower can be suggested. It blooms very profusely and the flowers will keep a long time aftercutting.

The cytissuses in many species afford an abundance of brilliant yellow bloom

CACTUS DAHLIAS.

at this season. *Cytisus biflorus* flowers profusely on the axils of the leaves of the old growth. The well known Scotch Broom (*Cytisus scoparius*) is now at the height of its glory. *Genista Germanica*,

the German Broom, is low growing and spreading, not over 15 inches in height and is very pretty.

A most useful spirea for florists' work is *Spiraea Cantoniensis*, fl. pl. The flowers

are in umbels, very double and of purest white. In bloom here first week in June.

The earliest *Philadelphus* to bloom is *P. speciosus*, and it is one of the best in form and size of flower and color. It

forces very readily and the flowers keep well after being cut. A few have been forced for the Boston market the past season.

Magnolia parviflora var. *major* is a new variety recently received from Parsons. The petals are pure white and stamens dark crimson, making a striking and beautiful flower.

In climbing plants *Wistaria brachybotris albus* is one of the hardiest and best. Its flowers are white, borne in racemes measuring from 2 to 2½ feet in length. W. J. S.

Boston, Mass., June 23.

Trees and Shrubs in Bloom July 4th.

BY WM. FALCONER, LONG ISLAND.

I am not sure that we can use the blossoms of many of the trees and shrubs now in bloom out of doors, as cut flowers with profit, but we certainly can make good use of some of them, for instance, *Spiraea discolor arifolia*. Cut flowers alone, however, are not the limits of a florist's use for plants, hardy or tender; if he has got a general plant trade he should be prepared to furnish the best and choicest shrubs, both deciduous and evergreen. In spring and early summer we have a vast variety to choose from, but as the summer advances the list of good flowering shrubs greatly lessens.

SPIRÆAS.—We have several handsome kinds now in good bloom. While it is easy enough to determine the species, among the names of the varieties there is considerable confusion, especially among those belonging to *S. Japonica*, *S. Douglasi* and *S. salicifolia*.

THE MAIN SHOOTS of *S. corymbosa*, a pretty white flowering species from the Allegheny Mountains, have done blooming, but several of the outer and shorter stems are yet terminated by dense white corymbs.

S. discolor arifolia is in beautiful condition, its small, dull white, fragrant fleecy flowers are arranged on terminal, drooping panicles that have a very elegant appearance. The plants are a little tender when young. What we had used to know as *S. Fortunei* is now called *S. Japonica*. It is a thrifty plant with broad flat corymbs of pink flowers now nearly in full bloom; a variety called *atrosanguinea* is quite deep colored and pretty, and another, *semperflorens*, is denser in the head and lasts longer in bloom than does the typical plant. *Spiraea Japonica alba* is what is generally called *S. callosa alba*, it is a compact bush and now covered with flat corymbs of white blossoms.

SPIRÆA BUNALDA also belongs to the *Japonica* section. It is of dwarf compact habit, about 2 to 3 feet high, fully as much across, has many yellow variegated leaves, and is now covered with flat corymbs of pink flowers. The best of all spiræas of its season.

SPIRÆA DOUGLASI is now and has been for over a week in fine bloom. The flowers are rose colored in dense, terminal, thyrsoid panicles. The variety called *Nobleana* is more vigorous and its panicles are less thyrsoid and more showy, and its leaves less downy on the under side. A dwarf form, 2 to 3 or 4 feet high, called *syriaciflora*, has been in good bloom for nearly two weeks, and is one of the prettiest shrubs now in the garden. Its flowers are rose pink in dense, but not thyrsoid panicles. *Spiraea Sanssouciensis*, another very fine variety of vigorous growth and belonging, I think, more to *Fortunei* than to *Nobleana*, is also in

fine bloom. Its blossoms are as deeply colored as those of *atrosanguinea*.

SPIRÆA ALBA, properly designated as *S. salicifolia paniculata*, is bursting into bloom. A vigorous but neat shrub, with ample terminal panicles of white flowers. *Spiraea crispiifolia* of catalogues is, I believe, *S. hullata*. It is a tiny shrub about a foot high, with deep pink flowers that appear about the middle of June and last all summer.

HYDRANGEAS.—The oak-leaved hydrangea, *H. quercifolia* is in perfect bloom. It has large, thyrsoid panicles of fertile flowers with a good scattering of showy white sterile ones at the outside. It is indigenous to the rocky banks of streams in Georgia and southward, but is perfectly hardy at Philadelphia, and apparently here too, and lives fairly well in sheltered places at Boston. The early flowering form of *H. paniculata* is within three or four days of being in full bloom; the *H. p. grandiflora*, the one so common in gardens won't be in bloom for weeks to come; and the late flowering variety of the typical plant does not yet even show signs of buds forming. *Hydrangea Thunbergii*, a Japanese species, is in splendid bloom. It grows about three feet high and has flat cymes of bluish flowers, the perfect ones towards the middle and the showy sterile ones at the outside. It dies back a little every winter, but that doesn't matter for its roots are perfectly hardy and the young shoots bloom abundantly every summer. *Hydrangea vestita* var. *pubesces*, now past its best, is disappointingly sparse flowered.

STUARTIAS.—The comparatively rare *S. pseudo-camellia* has been blooming for about a fortnight. It is a Japanese shrub of large proportions, fast growing, but neat, full and branchy and very clean. The flowers are white, a little smaller than those of *S. pentagyna*, the American one that is hardy here, and more fugacious. The autumn coloring of the foliage of this Oriental shrub is very fine—gold and crimson. The *S. pentagyna* has single camellia-like crimp-edged white flowers, and it lasts in bloom for a month. It starts to bloom about eight days later than the Japanese species, and lasts in flower two weeks longer.

LESPEDEZA BICOLOR deserves the recognition of every gardener and planter; as yet it is very little known. It belongs to the pea family, comes from northern China and Japan, and is a hard-wooded but graceful shrub about six feet high. Its flowers are small, dark rose-purple and arranged in axillary racemes which are borne in the greatest profusion throughout the month of July. Our plants began to bloom five or six days ago. Do not confound this shrub with *Desmodium penduliflorum* which is entirely distinct and, a month later in blooming.

INDIGOFERA DOSUA, a small pea-flowering shrub from the Himalayas is opening its pretty rosey blossoms. It is not reliably hardy, but in a warm sheltered place it seems hardy enough here.

THE PRIVETS.—The Californian privet (*Ligustrum ovalifolium*) if grown as an isolated shrub and not as a hedge plant blooms splendidly about the first of July. The common European privet (*L. vulgare*) is now mostly done blooming, as is also *L. thota*, a species from Japan and Northern China. This last species is one of the most copious of all, still its flowers are not as showy as are those of the Californian privet, nor is the plant itself so good for hedge purposes. South of

Philadelphia the Japan privet (*L. Japonicum*) is one of the best flowering evergreens in the garden, but it is not quite hardy here.

BENTHAMIA JAPONICA.—This looks exactly like an American flowering dogwood (*Cornus florida*) in full foliage and full bloom at the same time, and might be appropriately termed The Summer Flowering Dogwood. Our plants began to bloom, that is the large showy petaloid bracts assumed their pure white coloring about the 10th of June, and they were in their finest condition between the 13th and 24th of June, and even now there are many perfect satiny blossoms upon the bushes. These shrubs seem to be perfectly hardy, very fine blooming even in the case of small plants, and are well furnished with deep green glossy foliage, and they are easy to transplant. I understand that Benthams and Hooker have now merged the genus *Benthamia* into that of *Cornus*.

BUDDLEIA.—The Chinese *B. lindleyana* is in fine bloom and has been for a week or more, and the Japanese *B. curviflora*, about six days later, is approaching its best. Both are coarse, soft, sappy-wooded, rank shrubs, from 5 to 10 feet high, but desirable in large gardens and parks for their July blooming nature. Their flowers are rose-violet or violet-purple, small and densely arranged in long drooping racemes terminating the arching shoots. *Curviflora* is the coarser growing of the two. The *B. globosa* from South America, and which is grown in England and Southern Europe is not hardy here.

PATIA MACROSTACHYA (*P. alba*), the dwarf horse chestnut, is well furnished with white racemose panicles, but the blossoms are not open yet.

COLUTEA (*Bladder semina*).—These began blooming some weeks ago and will continue in bloom for some time to come. They are not showy, but interesting because of their yellow or tawny pea flowers and inflated seed pods being carried upon the plants at the same time.

CYTISUS CAPITATUS is in full bloom. A dense, broad, branchy shrub about two or three feet high, woolly throughout, and each shoot tipped with a close-set bunch of yellow flowers. Not showy.

YUCCA FILAMENTOSA.—Only a few plants are in full bloom, but the flowers of all will be open inside of a week or ten days. The different plants differ a good deal from one another; the flower stems of some are eight feet high, others only three feet, and they also vary in earliness and size and form of their blossom. Indispensable. Easily raised from seed.

HYPERICUMS.—I cannot get into ecstasy over the shrubby species. When *H. aureum* begins to bloom, as it will in a day or two, it will be lovely, but after a few days when the first open flowers wither and seed pods are formed all its beauty seems to have vanished, and between mopey buds, open blossoms, dead flowers and brown seed pods, it presents rather an untidy appearance.

ILEX LEVIGATA and *I. verticillata* are both in full bloom. The little white flowers are crowded all over their twiggy branches, to be succeeded, we hope, by as many scarlet berries in fall and winter. Although naturally swamp bushes they grow and fruit well in ordinary garden soil.

IPEA VIRGINICA was in its best bloom about the 25th of June, and it is still pretty well speckled with white. This little shrub indigenous to "wet places,

New Jersey and southward, near the coast," is a greater stranger in cultivation than it ought to be. It grows about four feet high, and in its season is densely laden with little racemes of fragrant white flowers.

CEANOTHUS AMERICANUS or red root is pretty well done blooming, but a few days ago it was fine; and *C. ovalis* has been out of bloom for some weeks.

CALYCANTHUS LÆVIGATUS and *floridus* have been blooming more or less since early spring.

SEVERAL SPECIES of *symphoricarpos* are in bloom, but their chief attraction is in their fruit in fall and winter. The elder bushes that were so gay along the roadsides and the field fences are nearly out of bloom. The purple flowering raspberry (*Rubus odoratus*) has its mission in damp, shady places, but is not good enough for the open garden. The wild bush-honeysuckle (*Lonicera trifida*), although past its best, will remain in bloom for some weeks yet.

THE SEASON of *Rhododendron maximum* is about over, but the smooth azalea (*A. arborescens*) of the Alleghenies, and the commoner clammy azalea (*A. viscosa*) have many fragrant blossoms left. *Rhodotypes kerrioides* has begun to bloom again. Handsomely fruited shrubs are also playing an important part in the decoration of our summer gardens, chief among them are the various bush honeysuckles (*Lonicera*) and daphnes, and greatest of all is *Elaeagnus longipes* whose branches are bending under their load of beautiful, bright, cranberry-like fruit.

ROSES.—The red and white *Rosa rugosa* have still a few blossoms and we get a good many flowers from the general garden varieties. From now on, however, Mrs. DeGraw performs her missionary work, and we rely upon this local and almost unknown variety for the bulk of our roses between July and October. Of course the double flowered prairie roses are laden still, but later and more beautiful by far is the plain prairie rose (*R. setigera*) itself which is now in its loveliest estate. The latest of all roses, however, is *Rosa foliolosa*, a single, white flowering species from Texas. Its first blossom of the season opened to-day. It grows only about 15 to 20 inches high, but is withal a thrifty plant, with small, neat and abundant foliage.

WOODY VINES.—The Chinese *Wistaria* is unfolding a second crop of blossoms, and the climbing *hydrangea* of the south (*Decumaria*) is displaying its ample bunches of blossoms up the trunks of supporting trees. The trumpet creeper (*Tecoma radicans*) is still behind, but clematises, woody and herbaceous, are bright and gay enough. The Japanese honeysuckles are past their best, and the American trumpet honeysuckle, and its varieties are recovering from their insect plague and trying to look more cheerful than they did a month ago. But one of the sweetest of vines is the common white jessamine (*J. officinale*) which survived last winter unscathed and is now in vigorous growth and full of delicious white blossoms.

TREES IN BLOOM JULY 4.

When it comes to July we can not reasonably expect to have many trees in bloom, still we have a few to brighten up our gardens, perfume the atmosphere and add variety to the landscape. Among these late bloomers are:

EUROPEAN LINDEN.—Now we have got

an indefinite name, for not only does it include several species but also a host of varieties of these species. The species now in full bloom is *Tilia ulmifolia*; it is the latest of all. The one that was in bloom about eight days ago is *Tilia vulgaris*, and the one that bloomed a fortnight ago is *T. platyphyllos*. The first two have smooth leaves, those of the last named are pubescent on the under side, which is also green.

CATALPAS.—*Catalpa speciosa* came into bloom about the 20th of June. If well treated at all it runs more to wood and less to bloom while young than do the other species. *Catalpa bignonioides* is now opening its blossoms, but they are not full out yet, and *C. Kœmpferi*, the Japanese species, will bloom about the same time as *bignonioides*, and it is the poorest of the lot. I have never seen *C. Bungei* in bloom, and there are several old—never large, that is, tall—plants of it on Long Island.

CHESTNUTS.—Sweet chestnuts (*Castanea*) both in cultivation and the woods are in good bloom. Chestnuts do fairly well here and the Spanish chestnuts ripen moderately well. The "Numb" chestnut blossoms twice a year, but hasn't borne ripe fruit with us yet. The Japanese chestnut trees are not always early fruiting any more than they all are large fruiting, but they seem to be quite hardy.

KEULRETERIA PANICULATA is almost at its best. It is a small tree from northern China, with compound leaves and large terminal panicles of small yellow flowers that now have a very telling effect. These blossoms are succeeded by inflated capsules or seed vessels, which look most as ornamental as flowers. The Dictionary of Gardening tells us to propagate this tree "by cuttings of the young wood in spring, or by layers in early autumn." Considering that it bears seeds in immense abundance, and the seeds germinate with the greatest ease and certainty, who on earth is going to propagate it from layers?

PINUS LAMBERTIANA is just going out of bloom. The only reason for noticing this here is the fact that this Californian giant is the latest blooming conifer in our grounds.

Boston Notes.

The cut flower trade is in the dumps. Pond lilies both pink and blue are now in their prime.

The rose which comes to market in best condition at this season is the *Souv. de la Malmaison*.

Jos. Talley has a seedling carnation, a cross between *Mme. Carle* and *Snowdon*, which appears to combine the productiveness of *Snowdon* with the good quality of *Mme. Carle*.

C. P. Grimmer has removed his store a few doors further down West street. Otis Ruggles has also removed from Tremont to Boylston street. Boylston street will soon rival Tremont as a flower locality.

The Association of American Cemetery Superintendents will hold its annual convention at Boston at the same time as the S. A. F. Their headquarters will be at the American House.

A patch of *Calluna vulgaris* 25 feet long and 14 feet wide has been found growing at the edge of a pond near Halifax, Mass. This is an interesting fact, because rather unexplainable, as there is no sign of any habitation having existed near there and the presence of the heath can not be accounted for.

The Mass. Hort. Society has finally

secured Music Hall for the grand exhibition next August. This disposes of the plan for holding the exhibition on the common, which was originally adopted because it was understood that Music Hall could not be obtained at that time. The premiums offered in the schedule are very liberal, many extra and special prizes having been arranged for on account of the large number of visitors expected. Competition is open to all, and as the number of entries is already very large those desiring to compete for any of the premiums should correspond at once with Mr. J. H. Woodford, chairman of the flower committee, Horticultural Hall.

The Gardeners' and Florists' Club was treated to a most interesting and unique entertainment at the July meeting. Mr. Chas. Storer who has for some years past made a great many photographs and paintings of famous plants and beautiful views in and about the leading greenhouses in this section, exhibited by means of the stereopticon a large collection of these views before the club at Horticultural Hall. Among the pictures which aroused the most enthusiasm were those of some noted cattleyas and cypripediums belonging to F. L. Ames and The United States Nurseries, also views in the grounds of H. H. Hunnewell, Esq., roses from Waban Conservatories, the greenhouses of J. N. May, R. M. Pratt and others, together with some portraits of well known personages, including F. L. Harris, David Allan, W. A. Manda, Wm. Robinson, J. N. May and others. Singing and recitations by members of the club added to the pleasure of the occasion, and it was unanimously voted to repeat the entertainment at some future time.

W. J. S.

Chicago.

James Farrell, one of Chicago's oldest florists, died at his home in this city June 30. Mr. Farrell was born on the green island about 45 years ago. He emigrated to Canada at the age of 25, remaining at Toronto for a short time, but soon found his way to New York City, where he was employed for a time by Mr. Hodgson, who was then located at the corner of Fifth avenue and 39th street. Here Mr. W. B. Farrell (or Doc, Farrell as he was better known) met him and induced him to come to Chicago. This was in 1872, the winter after the great fire. "Doc" Farrell had erected a small shanty on the corner of Wabash avenue and Harrison street, and here James Farrell introduced what was then known as the "eastern style" of making up—that is, arranging flowers loosely and gracefully instead of packing them together in a compact mass. He was one of the best floral artists of the present time, a rapid workman and possessing that most essential qualification of a good florist, the ability to make a handsome and effective arrangement with a poor and limited stock of material. He embarked in business for himself in 1875 in a small one-story frame building on Wabash avenue back of the Palmer House, where he soon succeeded in building up a good business and from which he accumulated some property. For several years past his health has been failing, and though a recent trip abroad to the place of his birth gave a temporary benefit, his old enemy—rheumatism—at last laid him low. He leaves a wife and two sons in comfortable circumstances.

Albert H. Hovey, the veteran seedsman and florist, for upwards of 30 years a resident of Chicago, died at Los Angeles,

THE AMERICAN FLORIST CO., Chicago.

THE SPRING PLANT TRADE.

In this issue appear reports of the spring plant trade from 77 of the larger cities and towns of the country, a majority of the reports having been compiled from data received from several florists in each place. Of these 77 towns 48 report an increase in the total sales varying from 5 to 30 per cent, 22 report them as about equal to recent past seasons, 5 report a small decrease and 2 are unable to make any comparisons owing to the newness of the trade in their cities. It is gratifying to note that nearly two thirds report an increase and only one fifteenth a decrease in the total sales, showing that the plant trade of the whole country has averaged a decided advance in volume. While unseasonable weather resulted in lowering the quality of plants in some sections the reports show that over the whole country quality has averaged somewhat better than usual.

Regarding collections 18 report them as more promptly made than usual, 44 as prompt as usual or satisfactory, and 8 as slower than usual, making the average for the whole country considerably above last year. This is a fairly reliable indication of general prosperity throughout the country, especially when considered in conjunction with the increased sales for ornamental plants are unquestionably a luxury rather than a necessity and people buy them freely only when their income is comfortably in excess of the amount required for what are usually termed the necessities of life.

In the older eastern cities competition is becoming extremely sharp and prices are consequently very low—too low to leave a profit in some cases, unless the cost of production has been brought down to a very low mark in those places. One correspondent says there is no money in growing 4-inch geraniums to retail at 75 cents or \$1 a dozen, and we agree with him, especially as grown by the average florist in small quantities, and if the plants are to be so grown as to give satisfaction to the purchaser when bedded out. The importance of being able to determine when prices have dropped down to, or below, the cost of production is again impressed strongly upon us. If florists knew when they were approaching this line they would be a little more judicious in cutting prices in the heat of competition, and education in this matter will unquestionably prove the best remedy for the evil of ruinously low prices.

A point in the reports which should not be overlooked is the frequency with which an increased call has been noted for hardy herbaceous stuff. The demand for this class of plants is undoubtedly growing.

PLANTS BY MAIL.—A reader writes that a small lot of rooted cuttings ordered by mail from an advertiser in the FLORIST was received in such a condition as to be absolutely worthless through having been packed in a paper box, which had been smashed in about seventeen different ways while in transit. We find it difficult to believe that any advertiser in the FLORIST would be so unwise as to attempt to send plants or rooted cuttings through the mails in paper boxes. Certainly every one sending such by mail knows that there is about one chance in a thousand of a paper box getting through without being smashed to pieces, the dampness which should be present to keep the plants fresh, taking from the paper box what little stiffness it may have had. No one should pretend to do a mail trade without a supply of the light wooden boxes made especially for mailing plants.

A MONTREAL florist says that a cemetery company has erected greenhouses and entered into competition with the florists in supplying plants to lot owners. The cemeteries are exempt from taxation and he asks if something can not be done to stop competition from a body which is thus exempt from bearing its share of the public burden. We can not say what can be done, but it does seem unjust to be obliged to pay taxes on your business and then be subject to the competition of an untaxed corporation. It is very likely that an examination of the charter of the corporation would suggest a line of action, as the powers of an untaxed corporation are always limited and it is probable that the company has overstepped its powers. This is a case for the Montreal Florists' and Gardeners' Club to look into. Here is where organization is of value.

ANNALS OF HORTICULTURE, 1889, by L. H. Bailey, is the title of a neat volume of 250 pages received from the Rural Publishing Co., New York. It is the initial volume of a series designed to preserve in convenient form a record of yearly progress in horticulture, and is a compilation of decided value to the busy workers who must have facts presented to them in as small a compass as possible in order to be available. The lists of introductions during the year will prove exceedingly useful. The chapter on tools and conveniences of the year is an excellent feature, but it is to be regretted that the printer placed the engraving of the pot washing machine taken from the FLORIST, upside down.

PRESIDENT JORDAN calls our attention to the fact that blanks have been sent to florists by a special agent of the eleventh census, and expresses the hope that there will be a full report by all in the trade so that the statistics regarding the profession may be complete. If you have not received a blank, the same may be had on application to J. H. Hale, special agent eleventh census, South Glastonbury, Conn. The statistics which will be thus accumulated will be of material value if complete, and we trust that every florist in the land will not fail to do his share toward making them so.

QUOTE FREQUENTLY readers send us articles and paragraphs clipped from local papers which are not only absurdly untrue, but in many cases viciously misleading to the public and harmful to the trade. We advise readers to send their comments on such articles to the papers publishing them and request a correction of same. While no attention may be paid

to the matter by some papers, we believe the majority will not refuse to insert such corrections. In this way the harm may be partly undone. The FLORIST can do but little good in this direction as it does not reach the people who may be misled by the paragraphs noted.

OUR ANNUAL convention supplement which will be published with our issue of August 15 will contain a sketch map of the city of Boston on which will be prominently indicated the Convention Hall, hotels at which rates have been secured, and many other items of immediate interest to the visiting members. Advertisements for the supplement will be received at usual rates.

OUR COLUMN of "sports" may excite a smile on the part of some of our dignified readers, but we feel assured that none will begrudge the boys a corner in the paper. Good wholesome sport is a relaxation which is of decided benefit to the busy workers in this pushing, hustling age, and should be encouraged so long as it is not carried beyond reasonable limits.

TIME AND LABOR saved is money saved. But you would hardly think this had been accepted as an axiom if you should observe the employes of certain florists slowly plodding along carrying small boxes of soil into the greenhouses for several days, when one man could have done the whole business in half the time with a properly constructed wheelbarrow or cart.

IN RESPONSE to our query as to whether he had found collections better or slower than previous years, a florist in an eastern city somewhat noted for its educational institutions, replied that he "couldn't say as he didn't sell collections." Several others seem to have misconstrued this query, which referred to the promptness with which customers paid their bills.

THE New York Sun of June 15 says there is no truth in the statement that the botanical gardens furnish flowers for half the private entertainments given in Washington, but says further that the beautiful exotics from the government greenhouses are distributed among the members of congress at their personal solicitation.

A VERY FINE form of *Cypripedium caudatum* roseum has recently bloomed with Mr. Wm. W. Lunt, Boston. The upper sepal was 6½ inches and the lower 7¼ inches in length, the pouch 2½ inches long and very broad with the staminate brighl carmine, the petals 33 inches in length.

IN your building and rebuilding don't fail to provide abundance of shed room, and have an entrance through which heavy loads can be hauled right in and material unloaded as near as possible to the place where it will be used.

A PHOTOGRAPH of a large plant of *Pelargonium Gipsy Queen*, bearing 30 trusses of bloom and 16 of buds, has been received from Mr. W. L. Thomas, Augusta, Ky. The photo was taken June 10.

A BEGONIA whose blossoms have "the fragrance of the freesia and something like a ripe apricot," will, it is prophesied, soon appear among the host of novelties.

SEND IN your adv. now for the convention supplement which we shall publish with the issue of August 15.

NOTICE

—OF—

STOCKHOLDERS' MEETING.

CHICAGO, July 10, 1890.

Stockholders of the American Florist Company:

You are hereby notified that the annual meeting of the Stockholders of the American Florist Company will be held in Room 200, Tremont House, Boston, Mass., Tuesday, August 10, 1890, at 3 o'clock p. m., for the purpose of electing directors and officers for the ensuing term, and for the transaction of such other business as may come before the meeting.

J. C. VAUGHAN, Pres.
G. L. GRANT, Sec'y.

AMERICAN FLORIST CO., Chicago.

☉Re Seed Trade.

SEED TRADE ASSOCIATION.

ALBERT M. McCULLOUGH, Cincinnati, president. JOHN FOTTLER, Jr., Boston, secretary and treasurer. The ninth annual meeting at Cincinnati, June, 1891.

American vs. Foreign Seed.

It is claimed by many that foreign is better than American seed and that home grown seed cannot be as good, as it is impossible to grow it here as well as in France, Germany or England. Let us consider this matter a little and see if it is really so. The facts seem to be that in these countries there are specialists who grow but a very few varieties and who devote their attention to nothing else. They make a study of these kinds and carefully select and allow to seed only those which are typical of the varieties grown, so, of course, the seed is good. If American seed growers did the same I can see no reason to prevent the results being the same.

One thing which has tended to prevent American specialists from succeeding is, the wholesale condemnation of home-grown seeds and the lauding of foreign by the largemajority of retailers. If they would be a little more judicious in their remarks of this kind and give our specialists some inducement we would have all the good seed that could be used.

As an illustration of how these retailers act I will state a little experience which I had with them this season. Having some pansy plants to sell this spring the retailers were visited and the invariable question was, "was the seed imported?" In receiving an answer in the negative they refused to take or even look at them. Finally one of them happened to see them and took the whole lot. Now these very same retailers wish to have plants for next season from the same strain of seed. The grower has become discouraged and engaged in other branches so it cannot be procured. ALFRED B. COPELAND.

Springfield, Mass.

The Great Debate on Garden Seeds.

The absurdity of that gigantic fraud annually perpetrated on the seedsmen of America is shown again in the debate given below from the New York *Mail and Express* of June 17. Last Thursday the House had under consideration the appropriation bill which contained the item for the Agricultural Department. One of those items was \$100,000 for garden seeds to be distributed by members of Congress.

Upon the reading of this item an amendment was proposed by Mr. Kilgore, of Texas, to the effect that the seeds for distribution shall be sent hereafter to county officials. Mr. Kilgore has a sanguinary name, but he is apparently a pacific person, although he comes from the Gulf State of Texas. He alleges that members of Congress use the seed of the Agricultural Department for electioneering purposes. He does it himself. The government, he says, furnishes seed for distribution, and it is human nature for members to distribute them to the best possible advantage. So far, so good, but Mr. Kilgore complains that the department seed will not go around in his district; that he is able, in fact, to furnish seeds only to one constituent out of every fifteen. Naturally, the other fourteen "kick," and says Mr. Kilgore plaintively, "I am not able to purchase seed for constituents, though I have frequently

been compelled to do so to meet the requirements of the public."

Another view of the case was taken by a Massachusetts member, Mr. Morse—usually known as "Rising Sun Morse." He believes in the distribution of seed by Congressmen. He avers that the present method of distribution has the effect to ally the people more closely to their representatives and to the government. In reply to the statement that the amount of seed given to each farmer would cost him only 5 or 10 cents to buy, he said, with a splendid burst of eloquence: "It is true that the farmer can go and get the seed. That anybody admits, but they do not seem as good to him as the seed he gets from his government. He plants his seed, and all through the summer as he looks at them growing he remembers that the government of the United States furnished them to him. He feels that the government loves its people; that it feels an interest in the success of its agricultural people, and I therefore hope that no different method of distribution will be adopted."

The debate was continued on the lofty plane to which Mr. Morse raised it. Members almost tumbled over each other in their eagerness to express their affection for their agricultural constituents and their eagerness to serve the farmers in their districts. Mr. Kilgore's amendment was ignominiously rejected, and Representatives will continue to sow the seed supplied to them by the Agricultural Department—supplementing the amount when necessary by purchase—broadcast among the farmers of their districts, expecting that it will in due time produce political influence in the shape of their own re-election.

STRONG EFFORTS are being made by interested parties to defeat the McKinley bill so far as it increases duty on seeds. Since the added duty on plants was secured by a single individual it may be that a single individual may remove it from seeds, but why should not the government representatives consult the national trade organizations regarding class legislation.

MR. ARTHUR M. KIRBY, for many years with Messrs. Peter Henderson & Co., was married at New York July 3, to Miss Eva A. Waterman.

PHILADELPHIA.—G. H. Schriver has been admitted as a partner in the firm of Z. De Forest Ely & Co.

News Notes.

SEATTLE, WASH.—The Seattle Floral Co. is building a new rose house 20x94.

NASHVILLE, TENN.—The firm of M. Tritschler & Son has been dissolved, the son retiring.

JAS. DEAN, of Bay Ridge, N. Y., sailed for Europe Saturday, June 21. Mr. Dean will return in time for the convention.

WORCESTER, MASS.—A very excellent display was made at the rose and strawberry exhibition of the local horticultural society June 26.

SYRACUSE, N. Y.—Louis F. Marquisee has built two new greenhouses 18x50 and 10x50. He has now five houses with over 6,000 feet of glass.

MADISON, WIS.—F. Scheibel, who makes a specialty of cut flowers, mainly roses, reports an increased demand of from 10 to 15 per cent the last year.

DENVER, COL.—Street vendors are becoming almost as much of a nuisance here as in the eastern cities. Recently Jaeger roses were offered at 25 cents a dozen.

VENTURA, CAL.—A floral society has been organized here with the object of encouraging the culture of flowers. Two exhibitions will be given each year, beginning with a chrysanthemum show next October.

KANSAS CITY, MO.—Newell & Kidd have a summer window attraction in an alligator about four feet long recently shipped them from Florida. Though it can hardly be called a beauty it attracts much attention from passers.

NORWICH, CONN.—Some of the finer and newer geraniums are here affected by an insect which feeds on the under side of the leaves. It is similar to the verberna insect, only larger. When the plants are bedded out it is not troublesome. It can be killed by fir tree oil.

HACKETTSTOWN, N. J.—Wm. B. Heymann for some years past foreman for Mr. Spangler the Dover florist, has formed a co-partnership with Wm. M. Everitt, and will establish a business here. A greenhouse 26x150 and accessory buildings are now in course of erection.

PROVIDENCE, R. I.—The Rhode Island Hort. Society will hold its annual chrysanthemum show in this city November 5 and 6 next. The exhibition of roses and strawberries given by this society last month comprised the finest collections of fruit and flowers shown here for a long time. Premium lists for the exhibitions of this society can be had on application to C. W. Smith, secretary, 55 Westminster street, Providence, R. I.

HARTFORD, CONN.—There was a magnificent display at the rose and strawberry show of the Hartford County Hort. Society. First prizes were awarded as follows: Best collection of hybrid perpetual roses, not less than 20 distinct named varieties, three each, Stephen Delbar, with 43 varieties. Best 6 hybrid perpetual roses, two each, E. M. Smead. Specimen plant in bloom, Burney E. Beemer. Sweet williams, best display of cut flowers, Miss E. G. Learned. Best floral display, G. William McClintic.

Mammoth Verbenas.

ED. AM. FLORIST.—Your issue of June 15 says that Mr. John F. Rupp writes that one of his Mammoth verberna plants has borne flowers as large as a silver half dollar and wants to know if any other florist has succeeded in growing flowers of such size. Individual florets of that size are certainly very scarce, but we have had perhaps a half dozen seedlings out of an acre grown for seed purposes that were fully of the size named. The Mammoth strain of verberna, it may be remembered, originated with the late Mr. Peter Henderson, who found in his annual sowing of seedlings from which our annual sets of new verbenas are made up, one plant that he called "America," whose single florets would more than cover a 25-cent silver piece. From that single plant originated the seedlings that were afterwards named and offered. In June of 1887 we had an acre of Mammoth verbenas growing for seed purposes, and it was our practice to go over the ground carefully twice a day, and in that year we found the five or six seedlings

that were fully of the size that Mr. Rupp states. We would say, however, that only two of these monstrous ones were perpetuated by cuttings, the habit of growth of the others being such that we discarded them. Possibly Mr. Rupp's variety may be one of that lot, or what is just as likely, he may have sown seed that produced his phenomenon.

ALFRED HENDERSON.

[Florets of the size mentioned are not rare, a very fine white which could not be covered by a silver half dollar was sent out in J. C. Vaughan's set of 1889. We believe specimens of the same size also exist in Dyer's Mammoth strain. We believe other mammoth strains have been sent out independent of the strain which originated as above.—Ed.]

Small Heating Apparatus.

We give below our method of heating a house 100x20 by hot water under pressure.

Build ash box two feet wide and two feet high; length of grate bars three feet. Make folds of pipe as in sketch and lay over the bars in the form of an arch or dog house; height of arch two feet above grate, length of folds 10 feet; two sections of six 2-inch pipes each will be required. Use malleable iron return bends and Ls for the joints in the fire; set the folds and place about one and a half inches of pine shavings over the pipes, then build brick work over the whole. When the fire is started the shavings will burn out and leave the pipes clear; if any remain unburned they must be taken out with a long hook.

A flue of twelve inches diameter may be used, or an upright stack with a close fitting damper to regulate the consumption of fuel; it will take four lines of pipe to each section, that will be eight lines of

pipe for the house. Make line of pipe continuous and not branched, but like the sketch.

Place an inch safety valve at the place shown and steam gauge on the flow pipe; a spigot must be on the return to admit the water, and while filling open the

safety valve to take the air out. Set the valve at 75 pounds and start fire, the valves will soon open and it will throw off all the water it does not require and then the pressure will soon go down and it will work a week without putting in any more water, with a pressure varying from nothing to 50 pounds according to the heat required. Use all 2-inch wrought iron pipe except for safety valves and water leaders; for these such sizes as the hose you have in use will be most convenient.

This arrangement is designed to heat a

house 100x20 to a temperature of 55° to 60° in zero weather. We don't claim any special advantages for this system, though we prefer it to the open 1-inch pipe system, and its low cost brings it within the reach of florists of small means.

Reading, Pa.

HOSKINS & GILES.

Hail Insurance.

ED. AM. FLORIST:—Please give space for our acknowledgement of the prompt and business like manner in which the Florists' Hail Association settled the damage to our greenhouses by hail on the 30th ult. If there are any foolish virgins left among the florists of America they had best get their lamps filled with out delay.

J. W. LOSEY, President.

Oak Grove Cemetery Association.
La Crosse, Wis.

IT CANNOT be denied that the most successful man is he who mixes a liberal amount of brains with his business, and throws open the windows of his mind to new ideas. The men who stick doggedly to the old fashioned methods, who run in a perpetual rut, will invariably find themselves outstripped in the race.

GREENHOUSE CONSTRUCTION.—A valuable series of articles on greenhouse construction by John N. May, liberally illustrated by figures drawn to a scale, appeared in Nos. 88, 90, 93 and 94 of Vol. IV, of THE AMERICAN FLORIST. We will mail these four issues to any address on receipt of 20 cents in stamps.

THE POOREST economy is economy in tools. Have every tool that will increase the effectiveness and speed of your work, and have every one in the best possible condition, that you may reap the full benefit of its assistance.

The Problem of Plant Registration.

ED. AM. FLORIST.—The California idea about the way in which to begin to have a system of registering plants has been somewhat misjudged in some quarters, as I am led to infer by the very bright report of the recent nurserymen's convention, which was printed in the AMERICAN FLORIST for June 15. The reason of this is probably that some of the first papers read upon the subject were both lengthy and heavy. But the root of the matter was in them, and there is now a regularly organized committee at work trying to reach some practical result.

I have had the honor to help a little in the work, and I can speak for others also, when I say that all that Californians expect in this matter is to have the national government establish and maintain a plant register. The first report of the special committee recommends first: An American plant register kept by the Agricultural Department; secondly, that this should contain the names and descriptions of all the species and varieties of plants cultivated in the United States; third, that any grower who originates a new variety shall receive a certificate. It recommends also, a bill securing exclusive propagation and sales rights for a limited period, on new varieties of plants.

All the details of the scheme are as yet unsettled; all such details are held by the Californians as subordinate to the main idea, and subject to open discussion, which is greatly desired. A practical working register is only possible upon the most simple plan. Business principles must prevail throughout. The scheme must be one which will command the respect and support of all honest florists, seedsmen and nurserymen, and of the best agricultural journals. The recently organized "Committee of Plant Registration," which has now its offices and its officers, and is at work in San Francisco, is only trying to have the official duty of compiling a plant register added to the work of the department. We wish it to be done in the most simple and efficient manner. We do not wish to infringe upon the work of the botanist. We shall welcome every useful suggestion that comes to us from any source whatever.

CHARLES H. SHINN.

NEW SEEDLING CHRYSANTHEMUM "ORANGE BEAUTY."

This novelty has been in bloom with us last year from September until June and is now in full bloom. We can supply fine plants in 2½-inch pots at \$1.50 per 10 plants, or \$16 per 100. Also a large stock of grand Duke Jasmine, 2½-inch pots, \$5.00, and 3½-inch pots, \$7.00 per 100. Jasmine multiflorum 2½-inch pots, \$3.50 per 100. Bouvardia Beckii and Cleveland, 2½-inch pots, \$3.00, and 3½-inch pots \$4.50 per 100. Alamanda Hendersonii, from 2½-inch pots, at \$7.00 per 100; from 3½-inch pots, strong plants, \$14.00 per dozen, or \$20.00 per 100.

Terms, cash with order or satisfactory reference.

NARCISSUS.

An immense collection and an enormous stock of all the leading varieties, especially of those adapted for forcing. Many acres are now in flower, and I expect I shall have at least

A MILLION

of fine forcing roots to offer this season, and shall be pleased to give prices for any variety for **EARLY FALL** delivery. A preliminary list has been sent to my customers, and my General Trade Catalogue will be ready shortly.

CLEMATIS.

My stock for Fall delivery will be much heavier than previous seasons. The varieties consist of all the best kinds and may be relied upon. Also many other varieties of Hardy and Half Hardy Climbers.

PYRETHRUMS.

Many thousands of these are grown and form one of the most important families of my Florist Flower Department. Also Carnations, Phloxes, Delphiniums, Pansies, Pinks, Hollyhocks, etc.

HERBACEOUS PLANTS.

The increasing demand for this group, both at home and abroad, has necessitated my adding several acres of fresh stock, in addition to my usual stock which is immense. Every good hardy plant is grown in large quantities, and I shall be pleased to quote prices for anything required.

DAHLIAS.

An extraordinarily complete collection, every variety of every section worth cultivating will be found described in my Retail Catalogue, published in April. Trade list of Pot Roots published in the Autumn.

HARDY BULBS.

Many acres grown, forming the most important branch of my Establishment, Anemones, Lilies, Chionodoxa, Gladioli, Begonias, Montbretias, and hundreds of other families too numerous to mention here.

CHRYSANTHEMUMS.

Every variety up to date, including English and Continental, full descriptions of which will be found in my numerous Catalogues, which may be had on application.

Rose Plants for Forcing.

Replying to Mr. Herms' query, roses for forcing next winter will produce in proportion to the strength of the plants. If the plants which were when received a month ago "little more than rooted cuttings," have been well cared for, they should be nice thrifty stuff now, and will with proper treatment do very well next winter, but not, of course, as well as would stronger plants. If he bought and paid for merely a rooted cutting he could hardly expect to receive a strong, established plant, but if the parties from whom the plants were ordered were given discretion to choose stock suitable for the purpose wanted then they were much to blame for sending him such small stock at that season. No sane person believes that a boy sincerely able to walk can earn his bread and butter as soon as a good strong one some years older, and the same principle applies to rose plants.

JOHN N. MAY.

OUR CONVENTION SUPPLEMENT will be published with the issue of August 15, and the map and directions it will contain will, we believe, be of considerable value to those attending the meeting at Boston. Exhibitors wishing to call special attention to their exhibits will find the supplement a very effective medium.

ORIGINAL AND LARGEST GROWERS OF

Lilium Harrisii Better known as The Bermuda Easter Lily

The Best in the World for Forcing for Winter Flowers.

WE OFFER ONLY STRONG FIELD-GROWN BULBS FROM OUR OWN GROUNDS IN BERMUDA.

THIS VALUABLE LILY IS OUR SPECIALTY.

We grow the bulbs by the acre on our own grounds in Bermuda. We were the first to grow it in large quantities and to offer it at reasonable prices, and we have always been recognized by the trade as

HEADQUARTERS FOR THE BERMUDA EASTER LILY.

Supplying the trade as we do both in this country and in Europe, and we hold by far the largest and the controlling stock of the genuine variety in the market.

The extent of our operations in this bulb alone will be best understood when we state that we expect to sell from OUR CROP of 1890, over a

HALF A MILLION BULBS.

Be sure you get the genuine *Lilium Harrisii*. In order to secure "the true variety," purchase your bulbs from original stock, which is known to be pure. The value of this Lily has led unscrupulous or ignorant parties to plant *L. longiflorum* in Bermuda, or grow it there one season and send it out as *Harrisii*, and dealers should look with suspicion on bulbs offered at prices less than market rates, as the supply has never yet met the demand. "Mixed Bulbs" only being offered at reduced rates.

This is not only the best by far of all lilies for winter blooming, but it is one of the most profitable flowers that can be grown by florists. It is very easily handled, and the flowers being especially effective for decorative purposes, always command large prices. From its name some have thought it was a bulb for florists' use for forcing for the Easter market only. This is not exclusively so; it derives its name from the fact that in Bermuda, grown in the open ground, it blooms at Easter time—hence the name "*Bermuda Easter Lily*"—but by growing it in this country in the greenhouse, with successive lots, it can be had in bloom all the winter from early in December until after Easter. In fact, by special culture, all the year round, or as long as cut flowers are in demand. The fact that it can be forced into bloom by the Christmas holidays adds particularly to its value as it fills in at a time when flowers are usually scarce and in great demand at high prices, but to accomplish this the bulb must be potted early in August, something depending upon treatment and temperature the bulbs we grow in.

For this purpose our Bermuda-grown bulbs are indispensable, as in Bermuda the bulb reaches its highest development, and ripens off perfectly, and is ready for shipment usually by the middle of July—before bulbs in our own country have barely begun to make their growth. Our bulbs being grown in the open ground, in a climate naturally adapted for their perfect growth, are particularly strong and healthy at any time.

New Crop will be ready for delivery early in August. Orders booked for delivery at that date.

Large growers or dealers in this bulb should write us for special prices, stating quantity of bulbs desired, and we will give lowest estimate on the same by return mail.

F. R. PIERSON & CO.,

TARRYTOWN, NEW YORK, U. S. A.

Sports.

Philadelphia.

The florists of this city had a gala day on Thursday, June 26. The occasion was a game of base ball, between the "Florists" and the "Chump Florists," on the grounds of the Lansdowne Athletic Association, which was won by the "Florists," by a score of 22 to 3.

Great rivalry has existed between the clubs for some time, but the Florists demonstrated that they could play ball, as well as cater to the trade of the fashionable world in the floral line. The Chumps caused great merriment by appearing in their new uniforms, prepared especially for the occasion by Manager Rice, on which he has applied for a patent. The features of the game were the fine battery work of Nebinger and Lewis, and Miller and Uber, the batting of Lewis and Miller, and the coaching of Longinett. Both pitchers pitched excellent games, but Nebinger received better support.

After the game, both clubs participated in an excellent lunch, prepared by Managers Heron and Rice. After the refreshments had been served, Manager Rice on behalf of the Chumps, presented to Captain Crawford of the Florists, in a very witty speech, a beautiful shield, with the following inscription:

CHAMPIONS, 1890.

FLORISTS BASE BALL CLUB.

The following is the score:

FLORISTS.	R	H	P	O	E	CH. FLORISTS.	R	H	P	O	E

Attention Bowlers!

The Gardeners' and Florists' Club of Boston will offer a \$50 cup to be competed for at Boston at the time of the S. A. F. meeting next month. A fine alley has been secured and competition will be open to all Florists' and Gardeners' Bowling Clubs. Full particulars regarding the rules which will govern the contest and the ownership of the cup may be had by addressing Mr. F. R. Mathieson, chairman of the committee on sports of the G. and F. Club, Waltham, Mass.

A Step in the Right Direction.

As a suggestion to other Florists' Clubs throughout the country we print below a document prepared by the Florists' Club of Washington, D. C., which will be presented to the proper authorities for action.

Be it enacted, etc.

Sec. 1. The Commissioners of the District of Columbia are hereby authorized to permit the erection of a structure of glass, iron and wood, the same to be of such architectural design and proportions as shall meet the approval of a board composed of the Engineer Commissioner, the Supervising Architect of the Treasury and the Superintendent of the Botanic Gardens. The said structure to be adapted and used solely for a flower market and to occupy Eighth street south of the line of Pennsylvania avenue to the present market buildings.

Sec. 2. Permission for the erection of said structure shall be granted to the Washington

Market Company upon satisfactory evidence being produced that the said Washington Market Company has entered into an agreement with the Florists' Club of Washington relative to size of structure, internal arrangements, care and maintenance, rentals, and such other matters as properly relate to the purpose of this act, which is to secure to the public a properly conducted flower market where all the advantages of competition and large selection may be obtained.

Sec. 3. The Commissioners of the District of Columbia shall assess and tax said structure and the ground it occupies in the same manner as other real estate is taxed in the said District.

Sec. 4. There shall be no construction of the text of this act to prevent any person who is a florist by profession from renting stands or sales room in the said structure, providing they be not in arrears for former occupancy of the said Market Company's stands, but the said Market Company may give priority of selection of stands, firstly to those who are already lessees of stands in their buildings; secondly to other florists who are residents of the said District; and thirdly to florists living outside of the said District.

Sec. 5. All disagreements which may arise between said Market Company and the said Florists' Club shall be settled by the principle of arbitration.

The Boston Convention.

Following is a list of Boston hotels at which arrangements have been made for delegates to the coming convention of the Society of American Florists. It is arranged according to distance from the convention hall, beginning with the nearest:

NORTHWARD FROM HORTICULTURAL HALL.

Name and Address.	Distance from Hall, per day.
Tremont House, Headquarters.	
Tremont St.	opposite \$3.00-5.00
Parker House,	
School St.	1 sqr. † 1.00-3.00
St. Nicholas Hotel,	
Province St.	½ " † .75-1.00
Boston Tavern (guests only),	
Washington St.	1 " † 1.00-2.00
Sherman House,	
Court Square.	1½ " † .75-2.00
Young's Hotel,	
Washington St. & Court Sqr.	2 " † 1.00-3.00

* American plan. † European plan.		

Rooms may be engaged now on application to any member of the committee on hotel accommodation. The committee is as follows: Wm. J. Stewart, 67 Bromfield street, Boston; M. H. Norton, Berkeley street, Boston; P. Welch, 165 Tremont street, Boston; J. Frank Curtis, Newtonville, Mass.; J. J. Cunningham, Readville, Mass.

The Reporter and the Simberbi.

The following clipping from a Boston daily purports to describe a bed painted at the city institutions at Deer Island: "The central design of the surface work is a large G. A. R. badge 12x6 feet. Every detail of the familiar insignia is faithfully worked out. The eagle which forms the clasp in the badge is composed of altanatheria ora and the crossed cannon beneath it are tropholibes, the sword being of St. Helena. The cannon balls are of simberbi and the bars of the flag are alternately of red altanatheria and white oca. The ensign of the flag is represented by a square of very striking blue imported flowers." Bonnets of Natural Flowers.

The season's belle is appearing at the theaters and at the last spring festivities in novel guise. Her evening bonnet is nothing more than a horseshoe fillet of wires which she has carefully filled in before leaving home with mountain laurel freshly gathered or lilacs or roses. One young woman who sat in front of me a few nights ago was garlanded with natural sprays of yellow honeysuckle and the effect was quite bewildering until the last act, when the poor flowers drooped under the combined influence of heat and tragedy. If the fashion becomes in any way general there will have to be florists next door to theaters, so that when one sex goes out between the acts for liquid refreshments the other can get its bonnet freshly and fragrantly decorated. Under this system it might even be possible to follow a play with sympathetic headgear; non-committal flowers like daisies or buttercups for the first act, passion flowers for those intermediate; mignonette, forget-me-nots, Bride roses or whatever the drama itself might suggest as most appropriate for the closing scenes. The proper order of flowers might even be indicated on the programmes. Seldom has a fashion been started with such chances of entertaining developments, and yet the chances are it will not go far. Few people take up a whim that is so extreme.—*Brooklyn Times*.

ONE way to make money is to take good care of the tools about the place. When these are permitted to rust out and become otherwise injured by lack of proper care the owner is losing money which could easily be saved. Another way is to have the hotbed sash, now not in use, piled up under cover with a strip of wood between each one to permit a circulation of air between them so that decay of the wood will not be incited by dampness.

THE ENTIRE STOCK of the new canna raised by M. R. Catlin, of Richmond, Va., has been purchased by V. H. Hallock & Son. It is of dwarf habit with orange scarlet flowers edged with gold.

**A CARMODY BOILER**

Will Cost Less, Use less Fuel, and has more advantages than any other Boiler in the market.

THE FURMAN STEAM HEATER

ESPECIALLY ADAPTED FOR WARMING GREENHOUSES.

Gives a most uniform heat night and day. Can be run with less attention, and a SAVING of fully 20 to 25 Per Cent. in fuel over any other method. Burns HARD or SOFT COAL. Endorsed by leading florists. Send for full illustrated Catalogue, showing how to pipe and heat a house by steam.

Address HERENDEN MANUFACTURING CO., GENEVA, N. Y.

THE NEW FURMAN HOT WATER BOILERS

BURN PERFECTLY SOFT COAL. 56 DIFFERENT STYLES AND SIZES.

Extract from OFFICIAL REPORT of the test made last winter by the Michigan Agricultural College:

"Our greenhouses are each 20x50 and 10 feet high at the ridge. They were easily kept at 50 to 60 degrees on an average DAILY consumption of 88 LBS. OF COAL during Dec., Jan. and Feb. The temperature of smoke was practically the same as water in flow pipe, and your Boilers proved in every way very efficient."

RAILROAD RATES.—To secure the rate made by the passenger associations when going to the Boston convention this month you will pay full fare going and when purchasing your ticket ask for a certificate of such purchase from the agent selling you the ticket. This when countersigned by the secretary at the convention will be an order to the Boston agent to sell you a return ticket at one third fare. Ticket agents are supplied with blank forms for the certificates.

THIS ISSUE completes the fifth volume of the AMERICAN FLORIST which shows an increase of 22 pages over Volume 4.

Boston in August.

The approaching visit of the S. A. F. to the Metropolis of New England is doubtless looked forward to by many of the members with much pleasant anticipation. Boston is in many respects the most interesting city in America, and those of our readers who may be fortunate enough to attend the convention which is to meet there this month will find, in addition to the advantage of participating in what promises to be a most notable meeting, much in the city and its surroundings to fully occupy all their time.

We present herewith a few views of interesting spots in and about Boston. Horticultural Hall is the property of the Massachusetts Horticultural Society, the leading horticultural society in this country and probably the wealthiest organization of its kind in the world. Here is located the splendid horticultural library of the society, comprising upwards of 6,000 volumes. The building contains two large halls, both of which have been generously placed at the disposal of the S. A. F. for their Boston meeting by the Mass. Hort. Society. The sessions will be held in the upper hall and the customary trade exhibit in the lower hall. The horticultural society still further honors the national society by changing the date of its annual exhibition of plants and flowers, so that it will take place at the same time as the meeting of the S. A. F. This exhibition will be held at Music Hall, one block distant from Horticultural Hall and will certainly be a great treat for the visitors.

A few rods from Horticultural Hall is the famous Boston Common. Crossing the common we come to the Public Garden, a most charming spot, which has been heretofore fully described in these columns and of which we herewith present a view. Starting from the Public Garden and running westerly through the wealthy "Back Bay" section of the city is Commonwealth avenue, 250 feet wide, which is claimed by Bostonians to be the finest residence street in the world. Our illustration shows a small portion of it.

No trip to Boston is complete which does not include a visit to Bunker Hill Monument. Its history is too well known to require any description here. It is situated less than two miles from Horticultural Hall and horse cars for the monument pass the hall every few minutes.

Two beautiful cemeteries of Boston, Mt. Auburn and Forest Hills, are well worthy of a visit. Our illustration shows a portion of the gateway to Forest Hills cemetery, and gives a good idea of the luxuriant growth of the Ampelopsis Viticuli with which it is covered, and which is used so extensively about Boston that it has come to be generally known as "Boston Ivy."

About 15 miles from Boston is the most beautiful private estate in America, that of Mr. H. H. Humewell at Wellesley, and it has been whispered to us that a trip to this enchanted land is one of the many enjoyable things planned by the Boston brethren for the entertainment of their visitors this month. Our illustration shows a new pavilion which has just been erected by Mr. Humewell. It overlooks the famous Italian Gardens and Waban Lake. In the distance may be seen a portion of Wellesley College.

The last of our views is famed Minot's Ledge Lighthouse which stands guard over the entrance to Boston harbor. The tower is 88 feet high and stands upon a rock which is hardly exposed even at low tide. In point of peril and difficulty in building, tragic history, cost and usefulness it can be compared only to the famed Eddystone, which in many respects it resembles. Two keepers are always on duty here, and it sometimes happens, especially in the winter season, that for weeks at a time communication with the main land is impossible. The rush of the sea herein stormy weather is tremendous.

To those who reverence antiquity and are interested in the early history of our country, Boston is full of interesting spots, many of them world famous, which have been jealously guarded through successive generations against the encroachments of modern improvements. We need only to mention Panel Hall, the "cradle of liberty," the Old State House, the Old South Church, the ancient church on Salem street in whose tower hung Paul Revere's famous signal lantern, the Old Granary Burying Grounds, where rest Paul Revere, John Hancock, and many other notable characters, and the old North End with its narrow, winding streets, quaint old buildings and other relics of colonial days. Then there are the noble universities which give to Boston its pre-eminence as a center of learning. Here too are the homes and the haunts of Longfellow, Lowell, Whittier, Hawthorne, Holmes and a host of the chief poets and philosophers of America. While the older portions of the city bear out fully its reputation for tangled and narrow streets, the more modern portion of Boston is laid out regularly in broad and beautiful avenues.

Particularly interesting to florists and horticulturists are the many parks, and public and private gardens which abound here. The Arnold Arboretum and Harvard Botanic Gardens will no doubt be magnets of strong attraction for many of the brethren. Among Boston institutions we must not fail to mention the Gardeners' and Florists' Club which is giving its best time and effort to help make the Boston meeting a success. Arrangements are being made by a competent committee of the G. and F. Club whereby visitors wishing to go to any

point of interest can be furnished with all necessary information or an escort.

Annual Exhibition Mass. Hort. Society.

In this exhibition, which will be held during convention week, competition is open to all and no entry fee is required. All exhibitors will be welcome wherever they may come from, and it is to be hoped that all who can possibly do so will enter in some of the classes. We append a list of the prizes offered.

All articles for competition and exhibition must be ready for examination by the committee at 12 M. on Tuesday, August 19. The exhibition will be open to the public at 9 P. M. on Tuesday, and will close at 9 P. M. on Friday.

Theodore Lyman Fund.

329	For the best Floral Design, and best kept for three days, to be examined each day, and the prizes awarded the last day, the Lyman Plate, value.	35	30	25
-----	---	----	----	----

Other Special Prizes.

Valuable special premiums will be offered for seedling verbenas by Peter Henderson & Co., for cannas and gloxinias by H. A. Dreer, and for items not yet named, by J. C. Vaughan, John Gardiner and the Society of American Florists.

The Trade Exhibition.

The number of applications for space at the exhibition has been so great that Horticultural Hall is not large enough to accommodate them all. It has been found necessary therefore to procure additional room, and Bumstead Hall has been secured. In this hall will be placed all the boilers and heavy goods, and this arrangement ensures abundant space for all who wish to exhibit. Bumstead Hall is one block from Horticultural Hall and

is on the ground floor of Music Hall, where the great horticultural exhibition is to be held, hence it is very central and desirable. Being on the ground floor heavy goods can be easily placed. For space in either hall address at once N. F. McCarthy, 1 Music Hall Place, Boston.

HORTICULTURAL HALL, BOSTON.

Symbolic Bedding at the Public Garden.

The formal bedding in the Public Garden is very elaborate this year and already attracts much attention. There are over sixty beds representing the badges of the various army corps scattered here and there throughout the garden, the details of each being very accurately worked out in echeverias, alternantheras, crassulas and other plants of like character, the whole showing a vast expenditure of patience and skill. Each bed is relieved by a background of dwarf conifers or palms and the effect is very pleasing. This public compliment in honor of the great G. A. R. demonstration will be highly appreciated by the "boys in blue." The rhododendrons in the garden have made a remarkably fine growth this year, and the roses too have been unusually good. The dry spell seems to have met the approval of the geraniums, they are a perfect blaze of bright color. The grass however, is woefully brown and scorched and unless soon relieved by copious rain it is likely that the visiting florists will get but a sorry impression of Boston's summer dress. It has been several years since this section has suffered so severely from drought.

W. J. S.

The Bowling Contest.

All teams wishing to take part in the great bowling contest at Boston should communicate with Mr. F. R. Mathieson, Watertown, Mass., at once, as entries will positively close August 10. The alleys on which the games will be played are 65 feet long. Nine inch balls will be used, either finger or solid according to roller's choice. Each competing team must be a bona fide representative of some organized florists' club, and shall consist of six members of such club. Three games will be played, the time for the same being one evening during the convention, not yet selected. The prize is a \$50 cup offered by the Gardeners' and Florists' Club of Boston, the cup to become the permanent property of the winning team.

In addition to the above trophy Messrs. F. W. Foster & Co., manufacturers of

steam and hot water heating apparatus, will offer through the Gardeners' and Florists' Club of Boston, three prizes for the best individual records made in the above contest, to be known as the "Foster Prizes," and consisting of gold and silver badges of special design, as follows: 1st prize, a gold badge, value \$35; 2nd prize, a silver badge, \$10; 3d prize, a silver badge, \$5, all to become the property of the winners.

W. J. S.

New York to Boston.

Members of the S. A. F. who will attend the convention from southern cities may be interested to learn that the palatial steamers of the Fall River Line, between New York and Boston have made a rate of one and one-third fares for the round trip on the certificate plan. The Philadelphia and New York delegates will go by this line, leaving New York at 5.30 p. m. August 18, and cordially invite all who can to join them. As the travel is very heavy at that season of the year only a limited number of state-rooms can be reserved for our accommodation and first come first served will have to be the rule, hence those desirous of securing state-rooms should write at once. Applications should be addressed to the undersigned with whom the company has placed the whole matter of state-room accommodation for the party. The tickets are good for three days before and three days after the close of the convention. Cost of state-rooms is in addition to price of ticket, and are \$1 and \$2 each according to location. Each room accommodates two persons, and a saving can be effected by two arranging to occupy one room.

Summit, N. J.

JOHN N. MAY.

Philadelphia to Boston.

The Florists' Club of this city at the last meeting decided to take the trip to Boston by way of the Fall River Route, and a right good time the members expect to have on that most popular of all routes to Boston. Much enthusiasm is evinced by all the "old timers," and many who have never before been to a convention have been enthused also, and a very strong delegation may be expected from this section of the country. For myself, I can speak, that a royal welcome awaits every member of the craft at the Hub. I have been there, consequently I know whereof I speak. Any member who hesitates to take the trip to the home of horticulture in this country will miss one of the greatest opportunities of his life to visit examples of what may, with justice be termed some of the most advanced types of horticulture in this country, both as to men and what has been accomplished by man in that line.

Any florist wishing to go with the Florists' Club of Philadelphia can not do better than correspond with John Westcott, 1514 Chestnut street, or C. D. Ball, Holmesburg, Philadelphia, either of whom will give them all the desired information about fares, time of starting, etc.

L.

Chicago to Boston.

The Chicago Florist Club has arranged for special cars from Chicago to Boston via the Niagara Falls Short Line, leaving

VIEW IN THE PUBLIC GARDEN, BOSTON.

Chicago at 9 p. m. August 17 and arriving at Boston August 19 at 9:55 a. m. The rate of one and one-third fares for the round trip amounts to \$25.35 by this route. Owing to the very advantageous arrangements made for special sleeping cars, the Chicago Florist Club has decided to bear this sleeping car expense on the trip down, and cordially invites all western florists who can make it convenient to travel via of Chicago to make use of these cars, free of expense to them. Club members are entitled to the same privilege. Send applications to G. L. Grant, secretary, 54 La Salle street, Chicago.

Convention Points.

ON TO BOSTON.

THE FULL programme of the Boston meeting was published in last issue.

BE SURE to get a certificate from the agent when you buy your ticket to Boston.

EXCURSION and banquet at Nantasket Beach with the Boston boys on Friday, the 22nd.

THE committee on nomenclature meets at the Tremont House Monday evening, August 18.

LOOK FOR our map of Boston which will appear in the Convention Supplement published with next issue.

MR. JOHN THORPE has been suffering from neuralgia recently, but hopes to be in good trim during convention week.

SEE LIST of hotels at which arrangements have been made for delegates in another column. Order your rooms now.

THE TRADE exhibit will be held in the hall below that in which the convention will assemble. Applications for space should be made to N. F. McCarthy, 1 Music Hall Place, Boston, Mass.

SEND in your annual dues (\$3) now to

Secretary Stewart, who will mail receipt and badge for 1890. This will save you some trouble on the first day and relieve the secretary from the usual rush at that time.

THOSE DESIRING to show plants and flowers at the annual exhibition of the Mass. Hort. Society which will be held at Music Hall, opening at same date as the convention, should make application to J. H. Woodford, Horticultural Hall, Boston, Mass.

THE CHANGING of the date of holding the annual exhibition of the Mass. Hort. Society so that it will occur the same week as the convention is a decided compliment to the national society, and the opportunity to visit such an exhibition will prove one of the most attractive features of the Boston convention.

OUR ANNUAL convention supplement which will be published with our issue of August 15 will contain a sketch map of the city of Boston on which will be prominently indented the Convention Hall, hotels at which rates have been secured, and many other items of immediate interest to the visiting members. Advertisements for the supplement will be received at usual rates.

WHAT A COMBINATION of attractions! The convention, the annual exhibition of the Mass. Hort. Society, the trade exhibit, the convention of the American Association of Cemetery Superintendents, the excursion to Nantasket Beach, the banquet of sea food, the day at Mr. H. H. Himmewell's magnificent country place, the many other horticultural attractions of the Hub, the buildings and other objects of great historical interest, the curious crooked streets of the old part of Boston, the bowling tournament, and with the Boston boys to meet us at the depot with a hearty handshake. Well, who could stay away?

Boston Hotels.

Following is a list of Boston hotels at which arrangements have been made for delegates to the coming convention of the Society of American Florists. It is arranged according to distance from the convention hall, beginning with the nearest:

NORTHWARD FROM HORTICULTURAL HALL.

Name and location.	Distance from Hall.	Rate per day.
Tremont House, Headquarters.	opposite	*\$3.00-5.00
Parker House,		
School St.	1 sqr.	† 1.00-3.00

Boylston St.	1½ "	* 3.50-5.00
Hotel Vendome,		
Commonwealth Ave.	1¼ "	* 3.50-5.00
* American plan. † European plan.		

Rooms may be engaged now on application to any member of the committee on hotel accommodation. The committee is as follows: Wm. J. Stewart, 67 Bromfield street, Boston; M. H. Norton, Berkeley street, Boston; P. Welch, 165 Tremont street, Boston; J. Frank Curtis, Newtonville, Mass.; J. J. Cunningham, Readville, Mass.

Philadelphia.

Where is the scribe that used to do up Philadelphia in such fine style? has he retired to his L(a)z(y) cottage to be heard from no more? We hope not, for his pen at least is mightier than his sword and his genial smile can always be seen between the lines.

The past season must have been a prosperous one hereabouts, if we are to judge by the new houses that are going up. Messrs. Geo. Anderson, Craig, Heacock and Burton are making large additions, while many more are adding one or two or lengthening out short ones and otherwise increasing their plant.

All this is going on now, but some time during the coming winter we expect to hear of a meeting of growers who will discuss "the best way to market cut flowers," "what shall we do with the surplus," "the commission man a failure," etc., etc. And the store men will enter their protest against the street fakir and general gloom will abound. Then along will come the cold snap and the fakir and the gloom will disappear and the growers will smile and pat the commission man on the back and next summer we will have more new houses. The idea must prevail in some men's minds that the man who will get the best place up above will be the man who has built the most houses.

The recent sales of plants from this city at Young's auction rooms in New York City were very satisfactory to all concerned; the stock offered was the best seen there this season and the prices obtained proved that well grown stuff will command a ready sale and a good price. Messrs. Craig and Harris are to be congratulated.

The stock of palms, rubbers, pandanus and ferns in this neighborhood is larger and better grown and in more variety than we have ever seen before. The houses of C. D. Ball and H. A. Dreer are packed to the doors with beautiful plants in all stages of growth from seedlings to specimens, while Messrs. Harris, Craig, Lonsdale and Burton have large stocks of well grown plants. Some of the specimen *Areca lutescens* of Mr. Burton are the finest ever offered to the trade from a commercial place.

The base ball fever has broken out in our midst and many sad cases are reported. Just think of it, four organized base ball clubs of all florists or managed by florists, all uniformed and with dates for every Saturday afternoon until the first of October. There are the Craigs, Florists, Grahams and Woltemates. The Craigs are from Craig & Bros.' nursery, the Florists are from the cut flower stores in town, the Graham nine is from Hugh Graham's Son & Co., and the Woltemates are florists and others of Germantown.

From all appearances the Philadelphia contingent to the convention at Boston will be very large. A great many of the country brethren as well as all the principal men of the trade about town are down to go, and every day some new name is added to the list.

A little niche for that \$50 cup has been fitted up and no doubt when our club house is finished it will occupy a conspicuous place and always remind us of that trip to Boston. A.

Boston Notes.

Mr. and Mrs. Jackson Dawson have just returned from a short visit to Portland, where they were the guests of Mr. J. A. Dirwanger.

BUNKER HILL MONUMENT, BOSTON.

Mr. Geo. A. Heinl, of Toledo, has been spending a few days at the Hub. Eastern air seems to agree with him.

Mr. W. C. Strong who was dangerously ill while away in Europe returned recently. He is gradually improving, but still shows plainly the effects of his sickness.

Mr. P. Norton and Mr. J. H. Woodford, chairmen of the committee of arrangements and the flower committee respectively of the Horticultural Society are as busy as bees booking entries for the great Music Hall exhibition. They report encouragement and enthusiasm on all sides.

Mr. C. M. Atkinson, the genial gardener in charge at the estate of John L. Gardner, Esq., is not generally very mischievous, neither is Mr. Wm. Robinson, in charge of Mr. F. L. Ames' place at North Easton, easily fooled, but Mr. Atkinson scored a rich one on Mr. Robinson recently, which was thoroughly enjoyed all round, and which either of them will no doubt be glad to relate to enquiring friends.

D. Zirngiebel has been making great efforts to have something good to show at convention time, and has now in his greenhouses at Needham grand collections of New French and "Marguerite" carnations and French cannas which will be just in at the right time.

At a recent Saturday exhibition in Horticultural Hall Mr. J. W. Manning, of Reading, showed 127 species, and 150 varieties and species of hardy perennials. The hollyhock show on Saturday, July 19, was very fine. Mr. J. S. Fay was awarded a silver medal for his exhibit.

On the afternoon of the first day of the convention the visiting ladies will be given a carriage drive by the Gardeners' and Florists' Club, taking in Brookline, Cambridge and other beautiful suburbs of Boston, and stopping at the pottery of A. H. Hews & Co., who invite them and as many of the gentlemen as choose to meet them there to inspect the working of the establishment, and will provide a lunch for all who come.

W. J. S.

COMMONWEALTH AVENUE. BOSTON.

Chicago.

Mr. John Lane has returned from his California trip.

On July 12 judgment for \$1,000 was rendered against the Neal Floral Co.

Mr. Peter Blaumeiser, of Niles Center, died recently. His son is carrying on the business.

Messrs. W. L. Morris and Chas. N. Page, of Des Moines, Iowa, paid Chicago a short visit recently.

Three new members were elected at the last meeting of the Florist Club. It is a curious fact that for five meetings three new members were elected at each meeting. Three seems to be a charmed number.

Every one wants to go to Boston and while it is as yet impossible to say how many can be depended upon to respond to roll call on the 17th, that there will be a goodly representation is beyond question.

E. Weinboer & Co. are making extensive additions to their glass at Park Ridge. The new buildings include two rose houses, 125x18 and 125x12 respectively, a propagating house 125x7 and a house 90x14 for general purposes. Hot water is the system used for heating.

At Lake Forest, Hild Bros. have added two new rose houses, one 125x21 and the other 56x21. Fred Anderman is off on a two months trip to Colorado to recruit his health. Wm. A. Kennedy, late with T. J. Slaughter, Madison, N. J., is now in charge of the McCormick rose houses.

The interest in the work of the Florist Club continues unabated. New members are continually coming in and the treasury is in a healthy condition. The final details for the fall exhibition are now being arranged and there is every reason to believe that it will show the usual advance over preceding ones.

Mr. Joseph Curran has left the position

he held for so many years with Charles Reissig, and rumor has it that he will soon open a store with his own name over the door. There is no more popular young man in the trade in this city than "Joe" Curran, and that he will have the very best wishes of every one for success in his new venture goes without saying.

From the amount of new glass being put up around Niles Center and Morton Grove there should be no shortage in the supply of cut flowers in the Chicago market the coming season. George Harter is adding 12,500 feet of new glass, Husecher, Mailander & Miller 25,000 feet, Pochlman Bros. 10,000 feet, Schiller & Mailander 16,000 feet, Peter Blaumeiser & Son 5,000 feet, Jacob Meyer 2,000 feet, and F. Stielow 4,000 feet. This is a total of about 75,000 feet of new glass at that point.

A project is on foot to organize a horticultural society for Chicago and vicinity, and the consideration of ways and means of accomplishing this object was the special order for the last meeting of the Florist Club. After considerable discussion a committee of five was appointed to secure the co-operation of as many amateurs as possible and then issue a call for a meeting for organization. A horticultural society existed in this county many years ago, but it never recovered from the disorganization which followed the Chicago fire of 1871. That Chicago and vicinity is in need of such an organization and that present conditions are favorable to the establishment and maintenance of a society which shall be a benefit to the city and an inspiration to all lovers of horticulture in this locality there can be no doubt.

Don't FORGET that convention supplement advs. must reach us by August 7 in order to secure insertion.

Long Island Notes.

BY WM. FALCONER.

HYBRID DELPHINIUMS raised from seed sown last January are now in bloom, a month later than the permanent border plants.

LUPINS.—I raised a lot of annual lupins and a German coming along exclaimed, "Why, that's the thing we raise so much of in Germany to plow under for green manure as you do with clover here."

INCARVILLEA OLGE is a hardy perennial from Turkestan. It has rose-purple campanulate flowers, freely borne at the ends of the shoots, and it is withal a thrifty, long-lived perennial, keeping green all summer and more or less in bloom all the time. I have grown it since it was introduced some ten years ago and fail to find the great decorative merit some claim for it.

JANUARY-STUCK CARNATIONS planted out late in April and not since cut back are in good bloom, and none are more copious than is Portia.

PLATYCODON GRANDIFLORUM NANUM (Mariesii) raised from seed sown March last, is now nicely in bloom, although only about 6 inches high.

CHRYSANTHEMUM MULTICAULE has been in good bloom for a couple of months.

HELIANTHUS RIGIDUS is now in good bloom. It is a hardy, perennial sunflower about 4 feet high, branched, very hispid, and with bright golden yellow dark centered sunflower blossoms 4 inches across. It spreads at the root and is easily propagated and well worth growing.

HIBISCUS CHRYSANTHUS comes from Natal and has large wide campanulate yellow flowers with a deep brown-purple throat. It is easily raised from cuttings and when planted out it blooms freely, but I don't think the flowers are much better than those of Okra or Hibiscus Africanus.

EAST LOTHIAN STOCKS.—Now that the large flowering German 10-weeks stocks are nearly past the East Lothian varieties are coming in in fine condition. They are good stocks and well worth growing for succession.

THE MOSQUITO PLANT (*Vincetoxicum acuminatum*) is still in good bloom and has been so for some months.

THE DOUBLE FLOWERING scarlet Lychnis Chalcedonica is one of the finest and most lasting of hardy plants. Old clumps divided last spring have given us many young plants now in full bloom.

THE DOUBLE FLOWERING PYRETHRUMS are becoming very popular. One prominent firm has stopped hooking orders for them for a season.

ASCLEPIAS TUBEROSA is now in gay condition. Although a wild plant here it is one of the handsomest of cultivated perennials. The way to get up a large stock of it is from seed. In saving seed be very particular to save it from the brightest colored flowers.

WHEN Gaillardia picta var. Lorenziana first came out there was a very wide difference in point of doubleness between the flowers raised from ordinary seed and the illustrations, but now on account of continued selection we get many flowers just as full double as any represented in the original pictures.

THE DOUBLE FLOWERING Corn Flower (*Centaurea cyanus*) is said to be double in the same way as are the flowers of *Gaillardia Lorenziana*. But really mine are not. Let us wait and hope, however, perhaps years of careful selection may do for the corn flower what they have done for the *gaillardia*.

TORENIA WHITE WINGS is having a big boom in England this year. A few years ago it was sent out here as a novelty. It is a pretty, continuous blooming little annual.

GLOBE FLOWERS (Trollius).—Last spring I broke up our old plants into as many well rooted pieces as practicable and planted them out closely in rows. On account of the moist summer they have grown very well, and the *T. Asiaticus* and *T. Caucasicus* bloomed well a second time, only the second crop flowers were much smaller than the earlier ones.

DOLICHOS JAPONICUS is a bold, hardy herbaceous perennial vine with large leaves, and it will outgrow any other vine I know of. Our vines, starting last May have already run forty feet.

PLUMBAGO CAPENSIS planted out in summer blooms freely from midsummer on and gives us a pleasant shade of blue not easily found among other garden plants, and by pegging them down we can keep them as flat to the ground as a bed of geraniums.

PASSION FLOWER vines when planted out in a warm sheltered place in good, moist land not only grow vigorously but bloom profusely during the late summer months.

CLEMATIS FLAMMULA FRAGRANS is the most densely flowered vine we now have in bloom; the plants are like pillars of snow and delightfully fragrant. It is a little earlier than the typical form, but, really, I don't see any other difference between them and perhaps even this is due only to some local cause.

RAISING CLEMATISSES FROM SEED.—Gather the seed as soon as they are ripe, keep them for a few days to harden and then sow them in flat boxes filled with light soil. Put these boxes in a cold frame shaded over by brush or lath or out of

GATEWAY TO FOREST HILLS CEMETERY BOSTON.

doors on the ground in a somewhat shady place, and let them alone except to keep them clean. Next spring you may reasonably expect a nice lot of young seedlings, but not before then.

DMORPHOTHECA PLUVIALIS or Cape Marigold was very pretty in June and the early part of July, but it is past now and should be cleared away and replaced by something else. It is of no use as cut flowers. The double flowering variety is no improvement over the single one.

NICOTIANA AFFINIS is lovely at night and so fragrant; in the day time, however, its blossoms are shut and the fragrance gone. What about the *N. decurrens* that has been so widely sold this year? Is it the same as *N. affinis*? I find no difference between them, that is, judging from what I have got for *decurrens*.

GALTONIA CANDICANS or Hyacinthus candicans as we most generally call it, is now abundantly in bloom, and where it is grown in quantity there will be a continuous supply of blossoms from July till October. It is as easily raised from seed as is a crop of onions, the young bulbs are hardy and most of them will give blooms the second year. The bulbs "last forever," our biggest bulbs are now seven years old, and year after year they seem to grow larger and throw up taller flower scapes. But the old bulbs are not nearly so hardy as are young ones.

HYDRANGEA VESTITA is the same as *H. pubescens*, and I believe the same as *H. aspera*, and it is offered retail by French and German as well as home firms. This being so it would seem ridiculous for any American firm to offer it subject to Fay's

PAVILION ON THE ESTATE OF MR. H. H. HUNNEWELL, WELLESLEY MASS.

Prolific currant or Niagara grape-like stipulations.

MIGNONETTE MARVEL is a new variety from France. It was awarded two first grand prizes at the grand floral exhibition in June last, in connection with the Paris Exhibition. The flowers are described as "very double, pure white, of immense size and striking purity, and of exceptional merit for using in a cut state, especially for white bouquets. Owing to the flowers being so very double the seed is produced very sparingly." We have it in good condition. It is decidedly distinct from any other mignonette of my acquaintance, robust but compact, and its flowers have a green and white appearance and instead of being produced on long raceme-like spikes they are borne in dense panicles. Not very fragrant. I scarcely believe it will become popular.

SOME VARIEGATED-LEAVED SHRUBS.—The foliage of the yellow leaved elder has scalded a little, that of the white variegated one is perfect, but of course the white markings are limited in extent. Both kinds of variegated leaved altheas are as good as can be, and so too is the variegated leaved privet, but the golden leaved philadelphus and the variegated box maple are a good deal sun scalded. The variegated weigela is good, so too are the varieties of *Elaeagnus pungens* and the variegated Cornelian cherry. The white variegated *Cornus alba* keeps its coloring well, but as a handsomely variegated leaved shrub all subjects pale before *Cornus alba* var. *Spathii*. It is hardly as a rock and has a wealth of fine leaves richly and broadly variegated with golden yellow. It seldom "burns" in summer, and it is the best variegated shrub grown.

ARISTOLOCHIAS IN NEW ORLEANS.—Un-

der date of July 13, a gentleman in New Orleans writes to me: "I have just now three species of *aristolochia* in full bloom, they are *A. elegans*, *A. gigas* and *A. cymbifera*. Of *A. elegans* I have two strong vines and at present they are loaded with flowers and green seed pods. It is a very thankful plant, and seeds very abundantly, and a great many self-sown seedlings are coming up around the old plants. I have never, however, been able to get any seed from *A. gigas*; I presume it requires some special insect which we have not got to fertilize its flowers. The *A. cymbifera* is new with me, blooming for the first time this year. It is a very showy species as well as an oddity."

CALCEOLARIAS AND LEAF MOLD.—A gentleman of Providence, R. I., writes me that he has had excellent success in growing calceolarias. He used to include some leaf soil in his compost for them, but in correspondence with Mr. James the English specialist, Mr. James advised him never to use leaf mold in the soil for calceolarias. I always have used leaf mold mixed in the soil for them and have never known it to hurt them, but of all men living I know of no one better qualified to give an opinion on this point than is Mr. James, so in deference to his great experience I will omit the leaf earth from my calceolaria soil this season, and note the result.

Wild Flowers from Alabama.

From the mountains in northern Alabama a horticultural friend sends me a delightful little box of nature's posies—plants in bloom and plants long out of bloom. It contained *Viola pedata*, *Cypripedium pubescens*, *Spigelia Marilandica*, *Oxalis violacea*, *Gonolobus hirsutus*, *Smilax herbacea*, *Amianthium musce-*

toxicum, *Tephrosia Virginica* and some *asclepiads*. Also some seedlings of that extremely rare shrub, or small tree, *Rhus cotinoides*. And regarding them he writes me:

"Our bird's foot violets are simply gorgeous here, they actually rival the fine pansies. The *cypripediums* grow plentifully in the woods and in about the same sort of places as I have found them in New Jersey and Massachusetts. The local name for the *spigelia* is Indian Star Pink, and the *amianthum* is called Wild White Plantain. The purple *oxalis* abounds here as it does in northern woods. The *gonolobus* has a clematis-like look, and vigorous plants are quite pretty; it does well in cultivation. The *smilax* is a very interesting plant. I have found some magnificent specimens of it with sprays of its curious seed vessels a foot long. The *tephrosia* is common in the woods, and the white, and orange (*tuberosa*) *asclepiads* keep in bloom most all summer." All of the above plants are, with a little extra care, hardy on Long Island.

About the *rhus* he writes: "The *Rhus cotinoides* is indigenous to this immediate vicinity and is here called Shittim Wood. The plants I have sent are one year old seedlings; it has never before been propagated. I should judge that it would make quite a desirable lawn tree, probably hardy with you, as we have zero weather here for a short time almost every winter, and our climate is more trying than yours. Its blooming time here is usually the latter part of April. Its flowers somewhat resemble those of the old smoke tree (*Rhus Cotinus*), only it is of more desirable form."

We already have a handsome specimen of this rare tree, 9 or 10 feet high, and five years planted, in flourishing condi-

tion in our grounds, and, so far as I know it is the largest plant in cultivation. Now, however, thousands of seedlings of it have been raised in Alabama, and, no doubt, it soon will become plentiful enough.

W. F.

BY JOHN N. MAY.

[Read before the Florists' Club of Philadelphia July 7, 1890.]

The forcing of this class of roses has undergone considerable change in the last few years, both in the mode of treatment and varieties used. I might mention here that the first hybrid roses ever bloomed at Christmas in the vicinity of New York, of which there is any record, was the result of an accident. The circumstance may be interesting to some of you, inasmuch as it completely upset the then prevailing idea among the best informed men on the subject, namely, that it was absolutely necessary to have all this class of roses frozen before they could be induced to bloom. The accident above mentioned was a very simple one. I had growing in pots some young plants of General Jacquemont intending to bloom them during February the coming season, and at the same time I had four plants only of Gloire de Rosamine, an old variety of very rich color which some years previously I had found to bloom very freely at a very early date, namely, early in January. These four plants I had given instructions should be left standing in the open air till middle of October and for the last month they were kept quite dry, but by some means these plants had during the summer been mixed up with the Jacqs and four plants of the latter substituted in their place. The wood being very much alike I did not discover the difference at the time, but on or about the 15th of October I pruned the four plants back to good sound eyes, placed them in the greenhouse with the ten roses and the result was that on the following Christmas eve I sent four very nice blooms of Jacquemont to New York, and the florist who took the roses I was then growing sent word back by our messenger that if I could send him one hundred blooms like those the next morning, Christmas day, he would send me a check for \$100. Of course I did not send the 100 roses, but I sent eight and got \$8 for them, and what was worth a great deal more I gained considerable knowledge, because it happened that the season in question had been an exceptionally mild and dry fall and up to the time these plants were put into the greenhouse we had only two or three nights on which there was a little white frost, heliotrops were still green near the greenhouse door when I put the plants inside. But although this was a pretty clear case as a lawyer would put it, I was still somewhat of a doubting Thomas, so to clear the matter up (and perhaps a little conceit was mixed up in it, for I thought, and well I remember it, "these old doctors don't know it all yet") I grew 100 nice young plants the next summer, treated

them as nearly as possible the same, and the result was we cut for the next Christmas and New Years eight hundred and thirty odd fairly good Jacq roses. But from the fact that they were grown in the same house and with the same treatment as the teas they were not as good as have since been produced under more favorable conditions. But I proved my theory, namely, that it was not necessary to have the plants frozen before starting them to grow. Since that date many thousands of fine blooms have been produced from plants that had not been subjected to freezing and I presume those who have tried early forcing of hybrids will agree with me that it is not absolutely necessary.

As that point may be considered settled I will pass on to the next, namely, summer and fall treatment, for herein lies the kernel of the nut we all like to crack. The past three seasons have been very unfavorable for this business on account of so much rainfall during the months of August, September and October. Formerly for very early forcing, growing in pots was considered the best method to follow, and for many cases it is undoubtedly the best yet, particularly for those who can not afford to devote a whole house at a time to this class of flowers, or maybe only requiring a few blooms at a time, therefore finding it desirable to prolong the crop as much as possible; for all such the pot system is undoubtedly the one to follow.

Select good strong plants in early spring, grow them on, shifting as required into larger pots till they are finally potted in 8, 9 or 10-inch pots, according to the strength of the plants. In potting the plants for the last time extra care should be taken to have plenty of good clean crocking placed over the bottom of the pot, not less than two inches, over which place a piece of thin sod, grass side down; this keeps it quite clean of soil (the pot should have a drainage hole of not less than two inches diameter). Then pot the plants as firmly as possible leaving the surface of the soil not less than $\frac{3}{4}$ of an inch below the rim to allow for an abundance of water during dry weather. This should be done not later than June 15, and if the plants are kept in active growth they will start new roots in five to ten days. At the end of that time they should be placed in the open air, and if hot weather sets in plunge the pots nearly to the rim in fine coal ashes, allowing each plant room to grow, keep them clean, water when necessary and syringe or rather hose them overhead frequently in dry weather. If properly treated they will have made good strong canes by the middle of August and have their pots full of roots.

If the plants are wanted to flower at Christmas commence withholding water, gradually at first; if the weather should be hot and dry water but once where they had been watered twice during active growth. After a week or ten days one watering will suffice where formerly three or four had been given, and by the end of 25 to 30 days they will stand a week with only a slight moistening overhead occasionally, but never allow them to shrivel. Should heavy rains prevail they should be lifted out of the plunging material, and when the tops indicate that all active growth has ceased they should be laid on their sides so that the soil does not get soaked with water, otherwise it will be so much labor lost as they would immediately push their bottom eyes into growth and the chances for getting flowers early are very slim; but by using

a little judgment in the matter this need never occur unless the weather is very unfavorable, such as the last two seasons have been. Then extra care and watching is necessary, but presuming that we get our usual fine September weather there is no difficulty in ripening the plants off finely, and if handled right they will be ready to prune by the end of September or first week in October. At this time the wood should be quite hard and solid, with some of the bottom leaves dropped off, but the bulk of the leaves still on the shoots, of a pale green color but still fresh.

In this condition the plants are fit to prune. They should be cut back to the lowest good sound eyes on each shoot, the small weak ones if any should be cut clean away. Clean the surface of the soil off very lightly, give a slight dressing of fresh soil to fill up the cracks around the edge of the pot, set on a bed of coal ashes and give two or three good soakings of water, enough to moisten the ball thoroughly throughout as many days. Syringe frequently till the eyes begin to swell. Should it threaten to rain heavily some means should be at hand to protect the plants, particularly after their eyes begin to swell, and as soon as possible after this they should be placed in a greenhouse. Keep the temperature for the first two weeks at 45° to 48° at night, with plenty of air during the day, gradually increasing it till the buds begin to show. At this stage the temperature should be from 52° to 54° at night. As soon as well set with buds begin watering liberally with liquid manure and continue it till the buds are cut, at least every other watering. It improves the flowers very much, both in size and color. From this stage till blooming is over an average of 56° at night should be maintained, with plenty of air during the day on all favorable occasions. At this season of the year it usually takes from 10 to 12 weeks to get the crop in full bearing. If required earlier, say end of November and first of December, it will take less time by ten days, as they have to be pruned in warm weather and consequently start much quicker in growth; and if required three or four weeks later than first mentioned they should have a little more time, usually twelve to thirteen weeks.

Another system followed is to put several plants in shallow boxes with from four to six inches of soil. These can be treated similar to the pot plants; the disadvantage of these is they are not so handy to move around in stormy weather, but where there is convenience for easily protecting them in case of adverse weather, they have many advantages over the pots.

Another system which is perhaps the simplest and best where a whole house is wanted to bloom at one time, and, where the crop can be disposed of readily, is to plant them on benches in early spring. Grow them on liberally so as to get good strong canes by the first of July, then take the sash off the houses and gradually withhold water till the wood becomes good and solid and presents somewhat the same appearance as described above for the pot plants. Then as soon as indications of rainy weather are noted place a row of 2x4 timbers along the bottom of the rafters, lay the sash on these and fasten so the wind will not blow them off. By this means all the heavy rains can be kept off the plants and at the same time it allows a free circulation of air through the house at all times. This keeps the wood in a dormant condition till time to prune it; when that

MINOT'S LEDGE LIGHTHOUSE, BOSTON.

is done the sash can be properly fixed on the roof, the benches have a good mulching of manure thoroughly soaked with water and started into growth in a similar way to that described for the pot plants. In growing them under this system great care must be used in the drying off not to allow the wood to shrivel, and at the same time they require to be thoroughly well ripened or the result often will be a large percentage of blind wood, or in other words the buds fail to set. Such a result would cause a considerable loss to the owner.

Varieties best suitable for this purpose. Of these there are several which have been grown for several years and proven to be well suited for this purpose, namely very early forcing. *Anna Alexieff* is the easiest and surest bloomer of all, next comes *Magna Charta*. General *Jacquemint*, *Anna de Diesbach*, Mrs. John Lining and *Mme. Gabriel Luizet*. Any or all of these can be grown either separately or together in the same house, but the grower will do well to ascertain so far as possible which varieties are the most in demand in his particular locality, and should confine himself principally to such. As an illustration, formerly *Anna Alexieff* and *Gen. Jacqueminot* were the most in demand in the New York market, now they are both of secondary consideration, *Magna Charta* being in best demand, while in Boston I understand the latter variety is not at all a favorite with the retail florist. There are several other

varieties that can be forced early, and I doubt not there are plenty more when they are thoroughly tested, but the above are the recognized standard sorts at the present time. These furnish a good assortment in size, shape and color, and with the exception of the variety first named are all very sweet roses.

In conclusion, past experience has taught me that medium or poor roses of this class are not wanted, but really fine blooms will always command a ready sale and be a credit to the grower and a pleasure to the consumer. In this as in all matters appertaining to our business let our motto be *Excelsior*.

Bedding Geraniums.

A first class bedding geranium must have a good habit, grow well, propagate rapidly, bear freely blooms of good size and distinct bright color which will stand pelted rain and blazing sun, and a combination of all these good qualities is rare enough in spite of the introduction of innumerable new varieties every year. Again geraniums which do well in one locality are a comparative failure in another, hence any iron-clad list of the best geraniums can not be accepted for all points even in the same latitude. The nearest we can come to it is to give the experience of those who have made extensive trials in certain localities and this is valuable only in those localities and others where similar conditions prevail.

Superintendent Fred Kanst of the South Park system, Chicago, plants geraniums largely for summer decoration of the parks and boulevards under his supervision, and though he is continually trying new varieties it is very rarely that he finds one to add to his list of standard sorts, as is shown by the annexed list compiled in response to our request for the names of those which he had found best for general purposes in his experience at South Park.

SINGLE.

1. *Clement Boutard*, white, large pip and truss.
2. *General Grant*, scarlet, large truss.
3. *Lucins*, orange rose.
4. *Ralph*, dark amaranth purple, profuse bloomer.
5. *Rev. A. Atkinson*, dazzling scarlet.

DOUBLE.

1. *Sapeur Pompier*. No one who wishes to have a brilliant display of flowers in their garden should be without this old sort, for it stands the hottest sun and holds its foliage well.
2. *Pres. Leon Simon*, red, constant bloomer.
3. *Dr. Jacoby*, salmon, constant bloomer.
4. *Ernest Lanth*, dark red, constant bloomer.
5. *S. A. Nutt*, dark red, tinted scarlet maroon shaded.
6. *Waddington*, dark pink, large truss.
7. *Naomi*, flesh pink.
8. *Candidissima flore-plena*.
9. *Golden Dawn*, bright orange red.
10. *Clipper*, scarlet, semi-double.

Mr. Kanst adds: The above are the varieties that I depend on for the principal display, but have about thirty other varieties that I make use of, and some of them are pretty fair bedders.

What's Its Name.

A gentleman in Illinois sends me a leaf and flower of a plant for name, and adds this tid-bit: "I have asked five or six florists and got five or six names, and have asked three botanists and got three names, and no two alike!" Well, this is humiliating enough, but please be merciful. You cannot expect that we poor fellows who earn our bread by the horn of our hands and the sweat of our brow, are systematic botanists and conversant with the names of plants not directly in our line of work, and no more can you expect botanists to be florists and acquainted with the names of garden varieties of horticultural plants. But the S. A. F. should not be in this dilemma. And I sincerely hope that the society will, at its next meeting, take some steps towards helping its members in this direction. I firmly believe in the advisability of making arrangements with some reputable, systematic botanist, who would undertake, for a consideration, to name all plants, apart from horticultural varieties, sent to him through the authorized channels of the society. W. F.

Horticulture at the World's Fair.

The executive board of the Illinois State Horticultural Society met recently at Sailor Springs and issued a call inviting "The various national, state and other prominent horticultural and floral societies and nurserymen's and forestry associations to meet in convention at the Sherman House in the city of Chicago on Wednesday, August 27, 1890, at 10 o'clock a. m. to consider the best methods of properly representing the horticultural interests of the whole country at the

World's Columbian Exposition in 1893, and to formulate and discuss plans for making the horticultural department of that exposition so complete that it will be the pride of our people and the admiration of the assembled nations of the world. This convention will be composed of two delegates from each of the societies before mentioned in the United States and Canada."

Seasonable Notes.

Lateralis on plants for exhibition cut flowers should be kept cleaned off from this time forward. Buds should be selected on the very late kinds where they are required to be in flower by the 5th to 10th of November. By the middle of the month buds should be selected of many of the mid-season varieties, and by the 1st of September to the 15th all early flowering kinds should receive the same attention. Do not depend upon the actual number of buds intended to mature, for instance, if a plant is to carry four flowers or eight flowers save eight to fourteen buds, and then as the buds develop secure the most perfect and thin down to the right number.

Stopping of specimen plants should be completed by the 5th of the month, including even the earliest kinds. Training must be followed up closely, especially where there is unevenness or raggedness. Look out now for a little beetle which does serious damage to young growth, often causing blind shoots. Tobacco water, tobacco dust and slug shot are all good remedies.

For cut flowers for commercial purposes plants on benches must have strict attention as to watering. Syringe night and morning, and under no circumstances allow the plants to suffer. If planting has to be done with plants from 2½-inch pots, eight inches apart will be correct.

Plants for market work should be shifted into their flowering pots by the end of the month. JOHN THORPE.

and and

Conducted by CHARLES F. BAKER, Agricultural College, P. O., Ithaca, N. Y. send specimens of unidentified insects and diseased plants to him at above address.

A Parasite on the Rose Louse Braconid.

In discussing the rose plant louse (AM. FLORIST, Vol. V, No. 117), its parasite—a Braconid—was spoken of as probably being undescribed. Later it was learned to have been described by Provancher under the name of *Ephedrus incompletus*. Some further very interesting facts have been noted in regard to it. While studying them a large number of the parasitized lice were collected and placed in a breeding bottle. First a large number of the braconids appeared, and after a time some very minute chalcids (*Isocratus vulgaris*, Walk.) were found in the bottle. These chalcids are undoubtedly parasite on the braconid and consequently injurious; not that they do any direct injury

but that they destroy a beneficial insect. That the chalcids were secondary parasites is more plainly seen in the fact of their not appearing until some time after the braconids. The braconids would thus have time to mate, deposit their eggs and the eggs to hatch before the chalcids appeared. They would then be ready to harbor the minute larvae of the chalcids at just the right time. Prof. Howard says that this chalcid is common in Europe, but not so in America, and is parasitic on other braconids besides the one on the rose plant louse.

Mammoth Verbenas.

ED. AM. FLORIST:—Without wishing to controvert the statement of Mr. Alfred Henderson in regard to the strain of mammoth verbenas, I would say that I always understood his father to admit that his strain was raised from the mammoth pink verbenas the "Beauty of Oxford," which I named and sent to him in 1876. This verbenas was raised by John Garvin, of Oxford, Baltimore county, Md., and sent out by me. It was a seedling from a verbenas formerly grown largely around Washington under the name of Mrs. Douglass. W. F. MASSEY.

THE AMERICAN FLORIST CO., Chicago.

A copy of the published proceedings of the fifteenth annual meeting of the American Association of Nurserymen, held at New York City last June, has been received from the secretary. It contains the many valuable essays read at the meeting, together with the discussions on same, all of money value to every one interested in the nursery trade. Membership in the association entitles to the report and the annual membership fee is but \$2. Those in the nursery trade who are not yet members should not fail to send the small membership fee to Charles A. Green, secretary, Rochester, N. Y., and receive the report.

A PEEP into the frame yard of one florist of our acquaintance who doesn't seem to be very prosperous, revealed a mass of pots—some whole but many broken—thrown promiscuously around as the plants had been knocked out of them, the sash scattered around in various dangerous positions—dangerous not only to visitors but to the sash themselves, as was evidenced by many a broken light. "Haven't had time to clean up any yet," apologized our friend as he arose from the hammock in which he had been lounging all the morning.

THE greenhouses and accessory buildings constitute the factory: the soil, fertilizers, stock plants, etc., the raw material; the hose, knives, pots, syringes, etc., the tools. As in other factories, the larger profit is made by the one which by the least expenditure in handling the raw material turns out the largest amount of product of good quality. Spare no labor which is absolutely necessary to ensure quality, but be sure that every move counts to the fullest possible limit. Run your factory on factory principles.

MR. BLANC sends us a letter received by him in which a request is made for a copy of his "Electrical catalogue for plants." In the accompanying note Mr. B. says: "Our catalogue men are evidently behind the age as you will notice by enclosed. Can't some of your readers 'enlighten' us on the subject? An 'electrical' catalogue must be a good thing. It would throw so much light on all that is new and all that is old that there would be no difficulty in making a choice."

THE FASHIONS in bedding plants are shown in a marked way at the New York auction sales; formerly no geranium could be sold but the General Grant, which sold very largely. Now doubles only sell and those in but a moderate way. Trays of *Centaurea candidissima*, fine plants, sold as low as one cent per plant. Alternanthera sold better but they are sure to suffer the same decline.

IF YOU HAVE anything to sell to florists, that you are convinced florists ought to

have, don't fail to show it at the exhibition in connection with the convention at Boston this month, and call the attention of the trade to your exhibit in the columns of our convention supplement.

A VERY neatly printed book containing prints of fifty varieties of daffodils has been received from Mr. W. B. Hartland, Cork, Ireland. The engravings are well executed, and the book will be of considerable interest to lovers of daffodils.

RECENT LOSSES paid by the Florists' Hail Association are \$99.25 to Augustus Doll, Manchester, Pa., and \$153.55 to John Juengel & Son, St. Louis, Mo.

SEND YOUR adv. for the convention supplement to reach us by August 7 at latest and as much earlier as possible.

AN Evansville, Ind., correspondent writes endorsing the bloom of the cotton plant for the national flower.

SUBSCRIBER will find the address of the Florists' Hail Association on the next to the last page of this issue.

News Notes.

DENVER, COLO.—H. Housley has added four new houses.

SPOKANE FALLS, WASH.—Rose Wright is building two new houses 50x20 each.

SIoux CITY, IA.—J. C. Remison is about to open a down-town seed and floral store.

FLINT, MICH.—D. P. Smith succeeds Smith & Evans, the latter having removed to Utah.

AURORA, ILL.—M. R. Saunders is building three 100-foot houses with widths of 11, 18 and 27 feet.

PHILADELPHIA.—Mr. Harry Bayersdorfer of H. Bayersdorfer & Co., has returned from his European trip.

MILWAUKEE.—A conservatory chapel will soon be built at Forest Home Cemetery. It will be heated by steam.

HARRISBURG, PA.—Mr. J. Laurence has been closing out the stock of the late G. Petterson, who died February 26 last.

SABETHA, KAN.—A long drought has seriously injured plants here. We have not had enough rain all summer to wet the ground an inch.

NORRISTOWN, PA.—A heavy hail storm smashed over 900 panes of glass on the greenhouses of E. Metcalf the evening of July 17. Loss estimated at \$200.

MONTREAL.—Walter Wilshire, the secretary, and Alfred Wilshire, the assistant secretary of the Gardeners' and Florists' Club, are both very ill with typhoid fever.

SPRINGFIELD, ILL.—H. P. Buckley has in course of construction three new houses. One 75x20, another 75x33 and the other 36x22. All to be heated by steam.

STILLWATER, MINN.—Alfred C. Bentley, formerly of Dubuque, Iowa, has bought out the greenhouses and trade of Mrs. Geo. Low, the purchase price being \$6,000.

LYNN, MASS.—Spring plant trade one-fourth larger. Prices about same as usual, 4-inch geraniums retailing at \$1.50 a dozen. Quality of plants was above the average. No change in collections.

BRICKSPORT, ME.—Spring plant trade was larger than usual. Quality of plants rather below the average owing to unfavorable weather. 4-inch geraniums retailed at \$8 a hundred. Collections are satisfactory.

BALTIMORE.—The schedule of premiums for the fall exhibition of chrysanthemums and other plants of the Gardeners' Club, to be held next November, has been printed. Copies may be had on application to Henry Bauer, secretary, 1875 N. Gay street.

SARATOGA, N. Y.—Spring plant trade about 25 per cent larger with increased call for palms. Prices were about as usual, 4-inch geraniums retailing at \$12 a hundred. Quality of plants was about same as previous years. Collections are about as usual.

MAYWOOD, ILL.—Amling Bros. have completed three houses 100x22 each and are building two more 100x19 each and one 100x10. All are to be heated by low-pressure steam. Mrs. M. H. Rockafellow has built three new rose houses 125x20 each, to be heated by steam. The Illinois Nursery Co. has opened an office here and will make this their headquarters.

WATERLOO, N. Y.—The body of Albert Dohles the florist was recently found in Owasco Lake. He is believed to have committed suicide while insane. The deceased was a member of the Society of American Florists and was well liked for his many good traits of character. He was 42 years of age, and leaves a widow and four children—two sons and two daughters.

MINNEAPOLIS, MINN.—Spring plant trade was about 25 per cent larger than usual. Prices were lower, 4-inch geraniums retailing at 10 cents to 20 cents each. Quality of plants was considerably above the average. Collections are about the same as last year. The increase in number of greenhouses since last year will more than double the output of plants. It is to be feared that the competition next spring will be uncomfortably sharp.

CEDAR RAPIDS, IOWA.—Florist H. G. Higley in conjunction with several of the churches and charitable institutions of this city will give an exhibition of chrysanthemums November 3 to 8. The exhibition will be held in a large tent decorated in Japanese style, the plants will be shown in beds as in a garden, and among them will be the booths of the churches, etc., presided over by ladies in Japanese costumes. "The Mikado's Garden" is the title adopted for the affair.

POTTSVILLE, PA.—The florists of this city are busy gathering up the broken bits of the glass which previous to July 17 covered their greenhouses. The damage is the result of a terrific hail storm on that date, the stones varying from the size of chestnuts to that of hen's eggs. J. M. Madison & Co. lost 18,000 feet of glass out of 20,000. They estimate the total loss including damage to plants at about \$2,000. John D. Joyce lost between 10,000 and 13,000 square feet of glass, and estimates the total loss at \$1,500. Charles Zimmer who had but recently became the owner of the Mount Vernon nursery lost 12,000 feet of glass. There was not a whole pane of glass left in the roofs of his houses and the falling glass and hail destroyed nearly every plant on the place. The storm covered a large area of this section of the state.

AMERICAN FLORIST CO., Chicago.

Re Seed Trade.

SEED TRADE ASSOCIATION.

ALBERT M. McCULLOUGH, Cincinnati, president; JOHN FOTTLER, Jr., Boston, secretary and treasurer. The ninth annual meeting at Cincinnati, June, 1891.

SMALLEY SEED CO. of McPherson, Kan. are reported to have failed with liabilities of \$12,000.

J. A. EVERITT SEED CO. is reported to have organized at Indianapolis, Ind., to succeed J. A. Everitt lately assigned.

THE ASSIGNEE of James King reports assets at full invoice value \$7,000; liabilities \$13,200. An offer of 25 per cent. is made in full settlement, one-third January 20, 1891; two-thirds June 20, 1891. Not secured.

W. W. RAWSON & CO. will remove their seed business to Arlington, Mass., and vacate their seed store in Boston. J. M. Gleason, who has been in the seed department of Rawson & Co., has commenced a business engagement with Schlegel & Fottler.

W. H. CARSON, of New York, has accepted the position of general manager with Mr. Henry A. Dreer, of Philadelphia, and is now in charge. Both Messrs. Schlegel & Fottler and Dreer may be congratulated in securing the services of two such capable men who have been so long and so favorably identified with the seed trade.

MR. WILLIAM RUDDELL, for some years traveler for W. Atlee Burpee & Co., of Philadelphia, died in that city July 21, of Bright's disease, aged 35 years. Mr. Burpee in a private letter speaks in the highest terms of Mr. Rudell's loyalty and faithfulness both to his employers and their customers. Mr. Rudell was well and favorably known in the American trade and his early death will be a matter of sincere regret.

THE TREASURY DEPARTMENT has always held and has decided as law that all importations of seeds must be assessed and duty paid on their market value at the time they are imported. This point has been decided on peas from Canada more than once, even when the importer swore that his invoice was correct and proved it to be a fact, the treasury department holding that the peas must pay duty on their market value when imported. In this connection the question arises "can American seedsmen contract with foreign growers for large quantities each year for a term of years, securing their supply a long time in advance and pay duty when imported on contract prices instead of actual market values at the time of delivery." Are not these seeds subject to duty under the treasury ruling at market rates? If so, would this matter not come in the line of investigation now being made by the committee appointed by the Seed Trade Association in regard to fraudulent importations. If seeds contracted for as stated above are being brought into the country contrary to law, should not the matter be ventilated?

Leaves of Advice From a Limb of the Law.

(For Young Florists.)

XIV.

Think of taking in a partner, do you? I suppose your idea is that because you

drew a prize in the marriage lottery you will be quite as lucky in the lottery of partnership. Your philosophy, sir, is bad. Every man's life has risks enough without creating them. A good business associate is a prize. But take care, don't crowd two bulls into a small pot.

Oh, yes, I understand, you want capital to increase your business. Not satisfied with slow growth and small income. The great mistake young men fall into is to imagine that the outside world knows anything about or cares anything about the written articles of a co-partnership, how they divide their profits, who is to sign and who not to sign, what one puts in and what another doesn't put in, etc. The only thing the world cares to know is who are the general partners and what is the nature and scope of the business. That's all. You can't change the liabilities of a co-partnership as to third parties by any articles you may draw up. Bear that in mind. If your partner goes to a money lender and asks for a loan for "partnership purposes" the lender is put upon his inquiry, but not so if your partner makes purchase of a thousand tulip bulbs. It may be a foolish transaction sure to end in a loss, but the act is binding upon you, no matter what your articles say or what private agreement you may have between you. You may bind your partner not to give a firm note or not to sell on credit, but suppose he does?

Some kinds of business, and yours is one of them, depend more largely upon skill, industry and application than they do upon the use of capital. Hence you should give this matter the weightiest consideration before signing any articles. As you may be aware, the moment partners fail to agree as to the manner in which the concern is to be managed, it becomes necessary to apply for a receiver to settle up the business. You'll see, therefore, at a glance that a co-partnership is a sort of "commercial marriage." But let us assume that you have found a proper bridegroom and that the sacred compact has been signed, sealed and delivered.

First, disability. A partnership—John Doe & Co.—can't hold real estate, it must be decided to the partners as tenants in common. It can not sign any instrument under seal, that is using its firm name. Each partner must sign individually and the fact of the partnership must be set forth in the body of the instrument. A power of attorney or chattel mortgage signed "John Doe & Co." is invalid. It can not be sued excepting by setting forth the name of each partner. But worse than all, one partner can not sue another. Whenever partners quarrel and it becomes necessary to examine and settle partnership affairs, there must be an accounting in a court of equity. But where the partnership had ended and one partner gives the other a note, due bill, mortgage or what not, of course they no longer stand in the relation of partners and may proceed as ordinary individuals. But understand thoroughly that simply because your books show a balance due you of \$1,000 you cannot sue your partner for it. It is not an ordinary debt in any sense of the word.

I'm glad you asked that question. I may answer that before a court of equity will interfere and order a receivership there must be some good and valid ground. Mere peevishness resulting from dyspepsia, or even acrimonious disputes, so long as they do not work damage to the business will not justify the court in terminating a partnership. Gross intem-

perance, neglect of business, wrongful use of partnership funds, wanton display of ignorance in business matters will always serve as basis for an injunction and receiver.

Now let us consider how a partnership may terminate. 1, By the consent of all the partners. 2, By the limitation of the articles. 3, By the death of one partner. 4, By the insanity or imprisonment for felony of a partner. 5, By the happening of some event; act of God or otherwise which makes the further transaction of business an impossibility. 6, By the discovery that the business is against good morals or is forbidden by law.

Now another thing. I have often heard you complain that it is difficult for a man to get justice done him nowadays; but wait until you have quarreled with a partner and then you'll have real cause to complain. Of course no written articles are needed to constitute a partnership. If you and your neighbor buy the contents of John Doe's nursery or hot house on speculation, that is with intent to sell and divide profits, you become partners as to that transaction, and it doesn't make the slightest difference in the world what your agreement was. Suppose it was to the effect that John Doe was to supply the money and you do the selling; and suppose further, that the transaction resulted in \$1,000 loss, you would be responsible for the whole amount. True, if you paid it you would have a right of action against John Doe for his share, but the daisies might grow over you before you could collect it.

Well, let us suppose that you go into this proposed partnership and get tired of it and withdraw from it after the first year. Now comes the question of notice to all your customers, and to the world at large, that you are no longer a member of the concern and must not be held liable for any notes or contracts made in the partnership name after your withdrawal. Unless you bring home notice of this dissolution your liability continues and you are at the mercy of an unscrupulous man. There are two classes of people entitled to notice, those who have had transactions with your firm and those who have not. A publication of the notice of dissolution will be binding upon the second class, but not upon the first. To cut off an old customer from any right to fall back upon you after your retirement you must be in a position to prove that he had personal notice of the dissolution. In other words you must be able to show that he read the notice or heard of the dissolution from you or from your agent or attorney. Usually partners imagine that merely mailing a printed slip to each customer is sufficient. It may answer all purposes or it may not. It is not conclusive. You must prove actual knowledge. For instance, if the customer wrote using the new firm style it would be proof of actual knowledge in him. It might be sufficient to show that the fact of the dissolution was generally known among business men and it might not.

You see that this question of partnership at once complicates business transactions. Therefore enter not into it lightly or without due consideration of all its phases. Admit that you double your income the first year, what will that avail you if you get into a dispute the second and "law it all away," as the saying is, in a court of equity quarreling over partnership accounts. I look on the dark side of things, do I? Well, possibly I do. Good day.

UNCLE BLACKSTONE.

J. C. VAUGHAN, CHICAGO.

SOME SEASONABLE FLOWER SEEDS, FOR IMMEDIATE SOWING.

VAUGHAN'S INTERNATIONAL PANSY.

VAUGHAN'S INTERNATIONAL PRIMULA MIXTURE, contains the most striking and brilliant colors. Pkt. 50c.

CINERARIA HYBRIDA GRANDIFLORA, VAUGHAN'S INTERNATIONAL MIXTURE, the finest large-flowering sorts, dwarf and semi-dwarf mixed. Pkt. 50c.

GLOXINIA HYBRIDA, best horizontal and upright, tigered and spotted in finest mixt. Pkt. 50c.

CYCLAMEN PERSICUM GIGANTEUM, largest flowers and best sorts mixed. Pkt. 50c and \$1.00.

STOCKS, BROMPTON AND EMPEROR WINTER, white, pink and crimson, each Pkt. 25c.

SMILAX SEED, new crop, oz., \$1.00; ¼ lb. \$3.00; 1 lb. \$10.00.

WALLFLOWER, best double mixed, Pkt. 25c.

MIGNONETTE MACHET, best for pots, Pkt. 10c; oz. \$1.00.

MUSA ENSETTE, new seed, per 100 seeds \$2.00; 1000 seeds \$17.50.

NEW DWARF MARGUERITE CARNATION.

The most distinct novelty of the season. It proved all we claimed for it in our spring list. We planted several hundred plants in our grounds and found not one single flower amongst them, all being double, fragrant and of good form and color. We will soon have new seed and can supply it at 25c. and 50c. per pkt.

VAUGHAN'S INTERNATIONAL PANSY MIXTURE comprises all the very best German, English and American strains, together with the Giant Bugnot, Cassier and Improved Trimardeau Pansies, and is undoubtedly the best mixture for florists. Pkt. 50c.; ½ oz. \$1.50; oz. \$3.00.

GIANT CASSIER, a choice variety of colors. Pkt. 50c.; ½ oz. \$1.50.

GIANT BUGNOT, the finest strain in existence. Pkt. 50c.; ½ oz. \$2.00.

GIANT TRIMARDEAU, WHITE, flowers very large with violet center. Pkt. 50c.

GIANT COALBLACK, very large and of fine form. Pkt. 50c.

GIANT TRIMARDEAU IMPROVED, contains all the new shades and colors and will therefore give entire satisfaction. Pkt. 50c.; ½ oz. \$1.50.

GIANT PANSY MIXTURE, this mixture comprises all the above Giant Pansies. Pkt. 50c.; ½ ounce \$1.00; ounce \$2.00.

VAUGHAN'S PREMIUM PANSY MIXTURE, a mixture of over 30 different shades, containing many of the most popular and odd colors. Pkt. 25c.; ½ oz. \$1; ½ oz. \$3.50; oz. \$6.

CHICAGO PARKS BEDDING PANSY MIXTURE, very choice. Pkt. 25c.; oz. \$2.00.

CALCEOLARIA HYBRIDA GRANDIFLORA, tigered and self-colored in finest mixture. Pkt. 50c.

HOLLYHOCK, best double white, pink, flesh, yellow and crimson; each, Pkt. 25c.

CARNATION VIENNA DWARF, a very good strain. Pkt. 15c.; ¼ oz. 50c.

VAUGHAN'S INTERNATIONAL CINERARIA.

We have some fine **FORCING ROSES**, 4-inch. Write for prices.

Scarcity of White Flowers Fall and Early Winter 1889.

I have been expecting to see in the AMERICAN FLORIST some comments on the, I think general, scarcity of white flowers, with suggestions of a remedy in future. No doubt many florists will remember the trouble they found in making up funeral desigues, etc., in many cases using immortelles and cape flowers in place of fresh flowers in close short-stem work. Most likely many florists will say that sort of work is out of date, others will say we used carnations and roses, but carnations at that time were scarce, and in many places roses none too plenty, and with many florists when roses and carnations give out there is nothing to fill in with. Alyssum often comes in useful for filling in, but cannot be used extensively. The different varieties of stevia and eupatorium are useful but they take up valuable space too long for the short season they are in bloom. Chrysanthemums fill the gap nicely for about six weeks, taking the place of almost everything else, but after they are gone a florist must look around for something to take their place and often look in vain. Romans can be had by November 1 but at that early season the spikes are few and small and must be used sparingly.

At the S. A. F. conventions many subjects come up for discussion and are discussed both wisely and well. I think it might be of interest to many florists to have the subject, the scarcity of flowers at a certain season and a remedy for such scarcity in future, discussed. If each member who took an interest in the discussion would name a plant or plants (omitting roses and carnations) which he is using for the season named, I think it would be the means of introducing many useful and possibly much neglected plants.

For many years past I have grown largely double white primulas and single white azaleas, both of which give perfect satisfaction, never any failure. The primulas come in bloom in November and are at best from early December until hot weather, the flowers a pure white and will remain for a week, either on the plant, in a box, or made up, which is more than can be said of carnations. For large bunches or vase work, stems from 7 to 10 inches long with 15 to 25 flowers and buds on each. I think anyone growing them for the first time will not discard them in a hurry.

White azaleas. I use the old India alba from October 1 to December; from then until June Fielder's White, which I find the best for cut flower work. Strong plants grown without pinching will furnish strong shoots from 7 to 10 inches long with from 6 to 20 flowers to a shoot, like a truss of rhododendron, of the purest white and will remain so for a week with the stems in water. Many of the double azaleas are useful after Christmas but as they make but a short growth they are not as useful for long stem work as the single varieties.

I do not know of any plants which give such satisfactory results with so little light, heat and space. Both can be grown in the same temperature as carnations and the dark days do not hurt them.

ZIRNGIEBEL'S NEW GIANT MARKET AND FANCY PANSIES

Have been exhibited everywhere and admitted to be the finest strains at the present time.

"Huge jewels of velvet and gold."—Boston Transcript, May 10th, 1893.

Trade packages of 1,500 and 500 seeds respectively, at \$1.00 each. Full printed directions for the proper cultivation of these pansies with each package of seeds.

IN ANSWER TO MANY INQUIRIES:

We have no seed of Giant Fancy Pansies to sell by weight, being too scarce and high. We renew our stock every season, from seed obtained direct from Messrs. Bugnot and Cassier, at the rate of thirty and twenty dollars per ounce, respectively (with a limited supply), as we consider their seed to be the cheapest, quality considered. We do not handle any other.

Cleveland.

The principal topic of conversation among the florists has been the recent hail and wind storms. It has always been supposed that Cleveland was not in the "hail belt" but recent events have entirely disproved that theory.

Among those who suffered in the storm of June 5 was Mrs. E. G. Campbell, who places her damages at \$600; Mrs. James Eadie of Glenville, who lost \$500; L. Warneke on Woodland avenue, who was badly peppered; J. Campbell & Son on Cedar avenue, Hills & Murphy on East Prospect street.

One peculiarity of this storm was that it came in rifts. Greenhouses situated only a block or two away from those so badly wrecked, escaped entirely, not losing a pane of glass. The damage to plants was also heavy. The storm came from the northwest and the hail (averaging the size of walnuts) came like bullets. They were solid clear ice and the wind drove them with irresistible force through whatever they encountered, passing through thick plate glass as readily as through single thick.

On June 23 we had our second great storm. This was of the nature of a tornado accompanied by hail. J. M. Gasser's Rockport plant lay near the track of the storm and he mourns the loss of over a thousand dollars worth of glass and plants. Three of his 100x22 foot greenhouses are so badly broken they will have to be entirely reglazed. Mr. Gasser has been peculiarly unfortunate at the hands of the elements this year, as earlier in the season he had an explosion from his coal oil tank which set fire to the sheds and greenhouses, ruining the smilax house, the palm house and burning out the ends of several others, which allowed the cold air to come in, nearly finishing what was left after subduing the fire. Mr. Gasser places his loss from all sources this year from fire, hail, wind and cold at \$6,000. Mrs. Campbell will be compelled to reset the best part of 6,000 feet of glass.

W. T. Long has opened a new floral store in the new Arcade building. He makes a very creditable show of flowers. The store is in charge of his daughter.

H. Reindfleisch has also started a new store near the corner of Pearl street and Franklin avenue on the west side.

Our market florists are complaining that this season's results will not equal last year, the weather being so much against them. The complaint seems general.

J. M. Gasser is hatching up some device to prevent loss from hail storms. He is going to experiment with several schemes.

We had a very fair crop of June and July weddings. Largely plants and loose cut flowers in vases—scarcely any designs. One kind of flower generally predominated, being classified as Sweet Pea weddings, Rose weddings, Marguerite weddings, etc. C.

—FRESH SEED:

We have made special arrangements with a large grower of this charming plant, and offer fresh, new seed at a price never before heard of. As long as stock lasts, we will fill orders from this advertisement at \$1.00 per thousand seeds.

John Gardiner & Co., 21 N. 13th Street, Philadelphia, Pa.

SMILAX.

My Smilax are from 2½-inch Rose and 3-inch Standard pots. They are cut back several times to make strong, bushy plants; and are in every way a first-class article that is sure to please. A sample of the largest and smallest size that will be used to fill your order, mailed on receipt of 10 cts.

PRICE, 2½-inch, \$2.00 per 100; \$18.00 per 1000. 3-inch, \$3.00 per 100; \$25.00 per 1000.

PANSIES.

Will have a full supply of fall grown Seedlings, through September, October and November at \$5.00 per 1000. 75 cents per 100, free by mail.

Quality is the principle feature in Pansies. My strain will meet all demands in this respect. Some of my customers say they are the best in the country. Give them a trial and judge for yourself.

— ORIGINAL AND LARGEST GROWERS OF —

LILIUM HARRISII, BETTER KNOWN AS THE BERMUDA EASTER LILY.

— BULBS NOW READY FOR DELIVERY. —

THE BEST IN THE WORLD FOR FORCING FOR WINTER FLOWERS. WE OFFER ONLY STRONG FIELD-GROWN BULBS FROM OUR OWN GROUNDS IN BERMUDA.

COPYRIGHTED, 1890, BY F. R. PIERSON, TARRYTOWN, N. Y.

From a photograph taken the week before Easter, 1890, showing a view in one of our new iron greenhouses, here at Tarrytown, 20 feet in width by 140 in length, a crop of *Liliium Harrisii* in full bloom. This house produced over 15,000 flowers for Easter.

This is not only the best by far of all lilies for winter blooming, but it is one of the most profitable flowers that can be grown by florists. It is very easily handled, and the flowers being especially effective for decorative purposes, always command large prices. From its name some have thought it was a bulb for florists' use for forcing for the Easter market only. This is not exclusively so; it derives its name from the fact that, in Bermuda, grown in the open ground, it blooms at Easter time—hence the name "Bermuda Easter Lily"—but by growing it in this country in the greenhouse, with successive lots, it can be had in bloom all the winter from early in December until after Easter; in fact, by special culture, all the year round, or as long as cut flowers are in demand. The fact that it can be forced into bloom by the Christmas holidays adds particularly to its value, as it fills in at a time when flowers are usually scarce and in great demand at high prices, but to accomplish this the bulb must be potted early in August, something depending upon after treatment and the temperature the bulbs are grown in.

For this purpose our Bermuda-grown bulbs are indispensable, as in Bermuda the bulb reaches its highest development, and ripens off perfectly, and is ready for shipment usually by the middle of July—before bulbs in our own country have hardly begun to make their growth. Our bulbs being grown in the open ground, in a climate naturally adapted for their perfect growth, are particularly strong and healthy at any time.

The extent to which this Lily is being forced for winter flowers will be shown by a sale made by us to a large New York grower, who purchased 20,000 bulbs for more than two weeks. It is a proper place. It bears shipping splendidly, as the two following letters will show. These were written acknowledging the receipt of flowers shipped last Easter.

J. L. Russell, Denver, Colo., writes: "The Lilies came in excellent shape. I don't think I lost one; it is a pretty good recommendation for your packing." The Fort Worth Nursery Seed and Canning Co., Dallas, Texas, writes: "The Lilies arrived in perfect condition, and we must compliment you on your packing. We would not have thought they would have carried so far packed dry."

THIS VALUABLE LILY IS OUR SPECIALTY.

We grow the bulbs by the acre on our own grounds in Bermuda. We were the first to grow it in large quantities and to offer it at reasonable prices, and we have always been recognized by the trade as **HEADQUARTERS FOR THE BERMUDA EASTER LILY**; supply'ng the trade as we do, both in this country and in Europe, and we hold by far the largest and the controlling stock of the genuine variety in the market.

The extent of our operations in this bulb alone will be best understood when we state that we expect to sell from OUR CROP of 1890, over

— HALF A MILLION BULBS. —

Be sure you get the genuine *Liliium Harrisii*. In order to secure "the true variety," purchase your Bulbs from original stock, which is known to be pure. The value of this Lily has led unscrupulous or ignorant parties to plant *L. Longiflorum* in Bermuda, plotting it with *Harrisii* to increase their stock rapidly when *Harrisii* was very scarce, thus mixing the stock irretrievably, thereby rendering it absolutely valueless for forcing and we have known instances where these mixed bulbs have been sold to large growers as the genuine variety, where large loss has resulted, and dealers should look with suspicion on bulbs offered at prices less than market rates, as the supply has never yet met the demand. "Mixed Bulbs" only being offered at reduced rates.

Large growers or dealers in this bulb should write us for special prices, stating quantity of bulbs desired, and we will give lowest estimate on the same by return mail.

F. R. PIERSON & CO., TARRYTOWN, NEW YORK, U. S. A.

OUR FREESIA BULBS ARE NOW READY FOR DELIVERY. They are of unusually fine quality, nearly twice the size of Bulbs usually sent out. Intending purchasers should write us for samples and prices, stating quantity wanted.

The Amateur vs. Professional.

This subject has been spoken of before in these columns, but I wish to tell a little experience we have had here this season and make a few observations which may give you some new ideas on the subject which is intruding itself upon us more and more each season all over the American continent, especially in the east.

There are a large number of people who do not and do not intend to make a business of floriculture, who every season grow a few plants or flowers, and oftentimes more than they have use for, and who sell them to retailers at prices far below what it costs to produce them, thereby injuring the trade of those who make it their business to grow plants and flowers for the trade, and it seems as if these retailers were more than willing to buy from these people in preference to those legitimately in the trade, and then "kick" when the growers or wholesalers will not sell at the same low price or find some other market.

Now, Mr. Retailer, are you doing the fair thing let me ask you? Do you think that you will keep the good will of these same wholesalers by doing this? Can you be surprised if they find a retail market for their goods in preference to selling at a reduction to you? Can you justly "kick" if they sell below the regular retail price in order to get rid of the goods which you refuse to take at a price which would only make a loss for them? But still you do "kick" when this is done and say that they are cutting prices and injuring the business. Now, would it not be better for you to buy of persons who make a business of growing or dealing in these goods at wholesale and let the others entirely and severely alone as far as buying is concerned? Wouldn't your trade be better in the end? Wouldn't these amateurs become discouraged in raising for market in a short time and leave the field to those in the business as a business.

The experience we have had here this season is as follows: There were several amateurs who had a lot of pansies and who sold them at prices "way down" and what was the outcome? Pansies went down and could not be sold at prices which they ought to have brought, as far as wholesalers were concerned. At the present time sweet peas and some other annuals are in the same condition from the same cause.

I have nothing to say against the amateurs raising these things, it is their right, but I do say that the retailers should be more circumspect in buying of them in preference to professionals.

Foreign Notes.

MR. GEORGE DEAL, for many years a prominent figure in the English horticultural world, died June 30, aged 56 years.

MR. FRANCIS DANCER, formerly one of the noted market gardeners of Middlesex, England, died June 29, aged 75.

ROSE SHOWS in England extend well into July. The great event of the rose season, the National Rose Society's Metropolitan Exhibition, was held at the Crystal Palace, Sydenham, on July 5.

THE FUNERAL of the late B. S. Williams was attended by over 400 friends who had assembled to pay their last respects to a man they held in sincere esteem.

REGARDING large attendances at flower shows, it is said that at the Shrewsbury Floral Fete in 1888 there was a total attendance of nearly 55,000 in two days, the receipts being nearly \$14,000.

HORTICULTURAL SUPPLIES.

PRICE, \$2.00.

AMERICAN FLORIST CO., 54 La Salle St., Chicago.

Florists' Letters.

Emblems, Monograms, Etc.
These letters and designs are made of the best materials, wired on wood or metal frames, having holes drilled in them to insert tooth-picks, by which they are fastened to the design. Give them a trial. You will find these goods to be superior to any in the market. PAT. AUG. 8, 1881.

NOTE—All infringers or imitators of the above letters and designs will be prosecuted to the fullest extent.
Send for Sample.

BALL PLAYERS OBSERVE.—There will be a game of ball in Boston—home club vs. the visitors—all those that will want to play please see Wm. P. Craig or Joseph Manda, Jr., at the Exhibition Hall, Boston.

ST. PAUL, MINN.—Mr. Leonard C. Chapin, the Lincoln, Neb., florist, was married to Miss Mila H. Atherton in this city July 23. The floral decorations at the wedding were very elaborate.

TRENTON, N. J.—The recent hail storm did serious damage here. Mr. John Savage lost about half of his glass and Messrs. Geo. Wainwright and W. J. Chinick about one-third of theirs.

A CARMODY BOILER

Will Cost less, Use less Fuel, and has more advantages than any other Boiler in the market.

Send for Descriptive Catalogue.

THE FURMAN STEAM HEATER

ESPECIALLY ADAPTED FOR WARMING GREENHOUSES.
Gives a most uniform heat night and day. Can be run with less attention, and a SAVING of fully 20 to 25 Per Cent. in Fuel over any other method. Burns HARD or SOFT COAL. Endorsed by leading florists. Send for full illustrated Catalogue, showing how to pipe and heat a house by steam.
Address: H. K. ENDEAN MANUFACTURING CO., GENEVA, N. Y.

THE NEW FURMAN HOT WATER BOILERS

BURN PERFECTLY SOFT COAL. 56 DIFFERENT STYLES AND SIZES.
Extract from OFFICIAL REPORT of the test made last winter by the Michigan Agricultural College:
"Our greenhouses are each 20x60 and 10 feet high at the ridge. They were easily kept at 50 to 60 degrees on an average DAILY consumption of 88 LBS. OF COAL during Dec., Jan. and Feb. The temperature of smoke was practically the same as water in flow pipe, and your Boilers proved in every way very efficient."
BE SURE AND GET OUR PRICES AND NEW CATALOGUE.
